
 hypermesh Matlab toolbox, User's Guide*
version 1.0.0

François Cuvelier[†]

March 7, 2019

Abstract

This object-oriented Matlab toolbox allows in any dimension d to generate conforming meshes of hypercubes, hyperrectangles or of any d -orthotopes by p -order simplices or orthotopes with their m -faces. It was created to show the implementation of the algorithms of [1]. The  hypermesh toolbox uses Matlab objects and is provided with meshes visualisation tools for dimension less than or equal to 3.

1 Introduction

The `hypermesh` toolbox contains a simple class object `OrthMesh` which permits, in any dimension $d \geq 1$, to obtain conforming mesh of a d -orthotope tessellated with p -order simplices or p -order orthotopes. Corresponding m -faces, $0 \leq m < d$ of the mesh are also provided. The number of m -faces of a d -orthotope is

$$E_m^d \stackrel{\text{def}}{=} 2^{d-m} \binom{d}{m} \quad \text{where} \quad \binom{d}{m} = \frac{d!}{m!(d-m)!} \quad (1)$$

Results and vectorized algorithms used in this toolbox are given in [1].

For dimension 1 to 3 and order 1 to 4, orthotope elements and simplicial elements are respectively represented In Table 1 and Table 2. In older toolbox(0.0.x versions) only order 1 was provided.

$d \backslash p$	1	2	3	4
1				
2				
3				

Table 1: p -order d -orthotope mesh element in \mathbb{R}^d . Nodes are the points.

$d \backslash p$	1	2	3	4
1				
2				
3				

Table 2: p -order d -simplicial mesh element in \mathbb{R}^d . Nodes are the points.

In Figure 1 and Figure 3 small meshes of the unit hypercube are given for both tessellations with 1-order orthotopes and 1-order simplices respectively in dimension 2 and 3. From these meshes, all the associated 2-faces meshes are represented in Figure 2 and Figure 4.

Figure 1: Tessellation samples of $[0, 1]^2$ with 1-order 2-orthotopes (left) and 1-order 2-simplices (right) where nodes (vertices) of all mesh elements are represented by black points.

Figure 2: Representation of all the 1-faces meshes with 1-order 1-orthotopes (left) and 1-order 1-simplices (right) obtained from the tessellation samples of the Figure 1

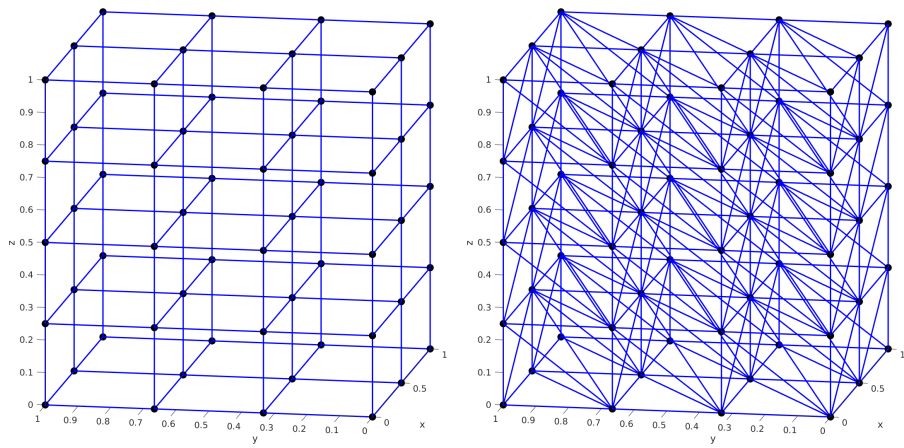

Figure 3: Tessellation samples of $[0,1]^3$ with 1-order 3-orthotopes (left) and 1-order 3-simplices (right) where nodes (vertices) of all mesh elements are represented by black spheres.

Figure 4: Representation of all the 2-faces meshes with 1-order 2-orthotopes (left) and 1-order 2-simplices (right) obtained from the tessellation samples of the Figure 3

By taking back the meshes in dimension 2 represented in Figure 1 and Figure 2, but this time using 3-order mesh element give the new meshes represented in Figure 5 and Figure 6.

Figure 5: Tessellation samples of $[0, 1]^2$ with 3-order 2-orthotopes (left) and 3-order 2-simplices (right) where nodes of all mesh elements are represented by black (vertices) and grey points.

Figure 6: Representation of all the 1-faces meshes with 3-order 1-orthotopes (left) and 3-order 1-simplices (right) obtained from the tessellation samples of the Figure 5

In dimension 3, meshes represented in Figure 3 and Figure 4 are this time tessellated respectively with 3-order orthotopes and 3-order simplices and represented in Figure 7 and Figure 8.

Figure 7: Tessellation samples of $[0, 1]^3$ with 3-order 3-orthotopes (left) and 3-order 3-simplices (right) where nodes of all mesh elements are represented by black (vertices) and grey spheres.

Figure 8: Representation of all the 2-faces meshes with 3-order 2-orthotopes (left) and 3-order 2-simplices (right) obtained from the tessellation samples of the Figure 7

It is also possible with the method function `plotmesh` of the class object `OrthMesh` to represent a mesh or its `m`-faces for $d \leq 3$.

This toolbox was tested on

Windows 10 (1803): with Matlab R2015b to R2018b

macOS High Sierra 10.13.6: with Matlab R2015b to R2018b

macOS Mojave 10.14: with Matlab R2018b

Ubuntu 18.04 LTS: with Matlab R2015b to R2018b

centOS 7.6.1810: with Matlab R2015b to R2018b

Fedora 29: with Matlab R2015b to R2018b

OpenSUSE Leap 15.0: with Matlab R2015b to R2018b

Debian 9.8: with Matlab R2015b to R2018b

It is not compatible with Matlab R2015a and previous.

In the following section, the class object `OrthMesh` is presented. Thereafter some warning statements on the memory used by these objects in high dimension are given. Finally computation times for orthotope meshes and simplicial meshes are given in dimension $d \in \llbracket 1, 5 \rrbracket$.

2 Installation

2.1 Installation automatic, all in one (recommended)

For this method, one just has to get/download the install file

`mfc_hypermesh_install.m`

or get it on the dedicated web page. Thereafter, it should be run under Matlab. This command downloads, extracts and configures the *fc-hypermesh* and the required *fc-tools* toolboxes in the current directory.

For example, to install this toolbox in `~/Matlab/toolboxes` directory, one has to copy the file `mfc_hypermesh_install.m` in the `~/Matlab/toolboxes` directory. Then in a Matlab terminal run the following commands

```
>> cd ~/Matlab/toolboxes
>> mfc_hypermesh_install
```

This is the output of the `mfc_hypermesh_install` command on a Linux computer:

```
arts of the <fc-hypermesh> Matlab toolbox.
Copyright (C) 2016-2019 F. Cuvelier

1- Downloading and extracting the toolboxes
2- Setting the <fc-hypermesh> toolbox
Write in ~/Matlab/toolboxes/fc-hypermesh-full/fc_hypermesh-1.0.0/
  configure_loc.m ...
3- Using toolboxes :
  ->          fc-tools : 0.0.25
  ->          fc-bench : 0.0.6
*** Using instructions
To use the <fc-hypermesh> toolbox:
addpath('~/Matlab/toolboxes/fc-hypermesh-full/fc_hypermesh-1.0.0')
fc_hypermesh.init()

See ~/Matlab/toolboxes/mfc_hypermesh_set.m
```

The complete toolbox (i.e. with all the other needed toolboxes) is stored in the directory `~/Matlab/toolboxes/fc-hypermesh-full` and, for each Matlab session, one has to set the toolbox by:

```
>> addpath('~/Matlab/toolboxes/fc-hypermesh-full/mfc-hypermesh-1.0.0')
>> fc_hypermesh.init()
```

To **uninstall**, one just has to delete directory

```
~/Matlab/toolboxes/fc-hypermesh-full
```

2.2 Manual installation

This package uses the `fc_tools` toolbox. So one has to install it as explain in the dedicated web page.

Thereafter, on the `fc_hypermesh` dedicated web page, one can found link to archives (*zip*, *7z* or *tar.gz* format)

- Downloads an archive and extracts it on a folder, for example `~/Matlab/toolboxes`. The toolbox path is `~/Matlab/toolboxes/mfc-hypermesh-1.0.0`
- Adds the toolbox path in Matlab with `addpath` command.
- Verifies that the `fc_tools` and `fc_bench` toolboxes are in the Matlab path. Otherwise, adds them...

3 Using the hypermesh toolbox

Before using this class it will be necessary to be aware of the memory used by this one. For example, when meshing a 6-dimensional orthotope with 1-order simplices by taking $N = 10$ intervals in each space direction, gives an `OrthMesh` object using 20 GB in memory. With 3-order simplices, the `OrthMesh` object use 241 GB in memory!

The memory usage for a d -dimensional `OrthMesh` object by taking $N = 10$ intervals in each space direction is given in Table 3 for 1-order elements and in Table 4 for 3-order elements. One can refer to Appendix A for more details.

d	<code>OrthMesh</code> (orthotopes)	<code>OrthMesh</code> (simplices)
1	8 B	80 B
2	688 B	2 KB
3	23 KB	96 KB
4	601 KB	4 MB
5	13 MB	288 MB
6	308 MB	20 GB
7	6 GB	1 TB
8	147 GB	145 TB

Table 3: Memory usage of `OrthMesh` object for the tessellation of an orthotope by 1-order orthotopes and by 1-order simplices according to the space dimension d and with $N = 10$.

d	<code>OrthMesh</code> (orthotopes)	<code>OrthMesh</code> (simplices)
1	8 B	160 B
2	1 KB	8 KB
3	135 KB	480 KB
4	8 MB	33 MB
5	438 MB	2 GB
6	21 GB	241 GB
7	968 GB	24 TB
8	42 TB	2 661 TB

Table 4: Memory usage of `OrthMesh` object for the tessellation of an orthotope by 3-order orthotopes and by 3-order simplices according to the space dimension d and with $N = 10$.

First of all, the main class object `OrthMesh` is presented. Thereafter some usage samples are given.

3.1 Class object `OrthMesh`

The aim of the `OrthMesh` class object is to efficiently create an object which contains a mesh of a d -orthotope and all its m -face meshes with either p -order orthotopes or p -order simplices. An elementary mesh class object called `EltMesh`

is used to store only one mesh, the main mesh as well as any of the m -face meshes. The `EltMesh` class is described in Appendix B.1.

Let the d -orthotope defined by $[a_1, b_1] \times \dots \times [a_d, b_d]$. The class object `OrthMesh` corresponding to this d -orthotope contains the main mesh and all its m -face meshes, $0 \leq m < d$. Its fields are the following

- `d`: space dimension
- `type`: string `'simplex'` or `'orthotope'` mesh
- `p`, order of the mesh elements
- `Mesh`: main mesh as an `EltMesh` object
- `Faces`: cell array of arrays of `EltMesh` objects such that `Faces{1}` is an array of all the $(d - 1)$ -face meshes stored as `EltMesh` objects, `Faces{2}` is an array of all the $(d - 2)$ -face meshes, and so on
- `box`: a d -by-2 array such that `box(i,1) = ai` and `box(i,2) = bi`.

3.1.1 Constructor

```
Oh = fc_hypermesh.OrthMesh(N)
Oh = fc_hypermesh.OrthMesh(d,N)
Oh = fc_hypermesh.OrthMesh(N, key,value,...)
Oh = fc_hypermesh.OrthMesh(d,N, key,value,...)
```

Description

```
Oh = fc_hypermesh.OrthMesh(N)
```

Generates the `OrthMesh` object `Oh` which contains a 1-order simplicial mesh of the unit d -orthotope and all its m -face meshes. `N` is a 1-by- d array used to obtain a regular discretisation with $N(i) + 1$ points in the i -th direction.

```
Oh = fc_hypermesh.OrthMesh(d,N)
```

Generates the `OrthMesh` object `Oh` which contains a 1-order simplicial mesh of the unit d -orthotope and all its m -face meshes.

- `d` is the space dimension
- `N` is a 1-by- d array used to obtain a regular discretisation with $N(i) + 1$ points in the i -th direction. If `N` is a positive integer then $N + 1$ points are created in each direction.

```
Oh = fc_hypermesh.OrthMesh(N, key,value,...)
```

```
Oh = fc_hypermesh.OrthMesh(d,N, key,value,...)
```

Some optional `key/value` pairs arguments are available with `key`:

- **'type'** : used to select the kind of elements used for meshing. The default value is **'simplex'** and otherwise **'orthotope'** can be used.

```
Listing 1: : OrthMesh constructor in dimension d=3 (orthotope mesh)
Oh = fc_hypermesh.OrthMesh(3,10, 'type','orthotope')
```

Output

```
Oh =
Mesh type : orthotope
dimension : 3
order      : 1
nq         : 1331
nme        : 1000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

- **'order'** : gives the order of the mesh elements (default is 1).

```
Listing 2: : OrthMesh constructor in dimension d=3 (simplicial mesh)
Oh = fc_hypermesh.OrthMesh(3,[10,20,15], 'order',4)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order      : 4
nq         : 202581
nme        : 18000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

- **'box'** : used to specify the **d**-orthotope $[a_1, b_1] \times \dots \times [a_d, b_d]$ by setting value as an **d**-by-2 array such that $a_i = \text{value}(i,1)$ and $b_i = \text{value}(i,2)$.

```
Listing 3: : OrthMesh constructor in dimension d=3 (simplicial mesh)
Oh = fc_hypermesh.OrthMesh(3,10, 'box',[-1 1;-2 2;0 3])
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order      : 1
nq         : 1331
nme        : 6000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

- **'m_min'** : used to only build the **m**-Faces for **m** in $[[m_min, d[$. Default value is 0.

```
Listing 4: : OrthMesh constructor in dimension d=3 (simplicial mesh)
Oh = fc_hypermesh.OrthMesh(3,10, 'm_min',2)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order      : 1
nq         : 1331
nme        : 6000
Number of 2-faces : 6
```

- **'mapping'** : used to apply on the mesh a mapping function given by a function handle.

```
Listing 5: : OrthMesh constructor in dimension d=3 (simplicial mesh)
mfun =@(q) [q(1,:)+sin(q(2,:));q(2,:);q(3,:)];
Oh = fc_hypermesh.OrthMesh(3,10, 'mapping',mfun)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order      : 1
nq         : 1331
nme        : 6000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

3.1.2 Access to OrthMesh's fields

In all examples given in this section, **Oh** is the **OrthMesh** object given by

```
Oh = fc_hypermesh.OrthMesh(3,10,'order',2)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order      : 2
nq         : 9261
nme        : 6000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

It's a 3 dimensional mesh of the unit cube tessellated with 2-order simplices where their vertices are in $(i/10, j/10, k/10)$ for all $(i, j, k) \in \llbracket 0, 10 \rrbracket$. The main mesh given as an **EltMesh** object is **Oh.Mesh**

```

Th=Oh.Mesh
-----
Output

Th =
EltMesh object
  type : simplex
  order : 2
  d : 3
  m : 3
  q : (3,9261)
  me : (10,6000)

```

The k^{th} m -faces of `Oh` stored as an `EltMesh` object is given by `Oh.Faces{Oh.d-m}(k)`.

```

Fh=Oh.Faces{1}(3)
-----
Output

Fh =
EltMesh object
  type : simplex
  order : 2
  d : 3
  m : 2
  q : (3,441)
  me : (6,200)

```

One can easily access to each field of an `EltMesh` object (see description in Appendix B.1). For example, to access the nodes array and the connectivity array of the `Th` `EltMesh` object we do respectively `Th.q` and `Th.me`. We also have the following link between global nodes array `Th.q` and local nodes array `Fh.q`:

$$\text{Th.q}(:, \text{Fh.toGlobal}) == \text{Fh.q}$$

or more generally, for all m in $\llbracket 0, Oh.d \rrbracket$ and for all k in $\llbracket 1, E_m^d \rrbracket$

$$Oh.Mesh.q(:, Oh.Faces\{Oh.d-m\}(k).toGlobal) == Oh.Faces\{Oh.d-m\}(k).q$$

where E_m^d is defined in (1).

3.1.3 plotmesh method

The `plotmesh()` member function can be used to represent the mesh given by an `OrthMesh` object if the space dimension is less than or equal to 3.

Syntaxe

```

obj.plotmesh()
obj.plotmesh(key, value, ...)

```

Description

```

obj.plotmesh()

```

```
obj.plotmesh(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'legend'` : if `value` is `True`, a legend is displayed. Default is `False`.
- `'m'` : plots all the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- `'labels'` : plot all the `m`-faces of the mesh with number/label in `value` list
- `'color'` : use to specify the color to use.
- ...

Other `key/value` pairs arguments can be used depending of `obj.d` and `obj.m` values and they are those of the plotting function used:

- with `obj.d=3` and `obj.m=3` , `patch` function is used;
- with `obj.d=3` and `obj.m=2` , `trimesh` function is used for simplicial mesh and `patch` function is used for orthotope mesh;
- with `obj.d=3` and `obj.m=1` , `line` function is used;
- with `obj.d=3` and `obj.m=0` , `scatter3` function is used;
- with `obj.d=2` and `obj.m=2` , `triplot` function is used for simplicial mesh and `patch` function is used for orthotope mesh;
- with `obj.d=2` and `obj.m=1` , `line` function is used;
- with `obj.d=2` and `obj.m=0` , `scatter` function is used;
- with `obj.d=1` and `obj.m=1` , `line` function is used;
- with `obj.d=1` and `obj.m=0` , `scatter` function is used;

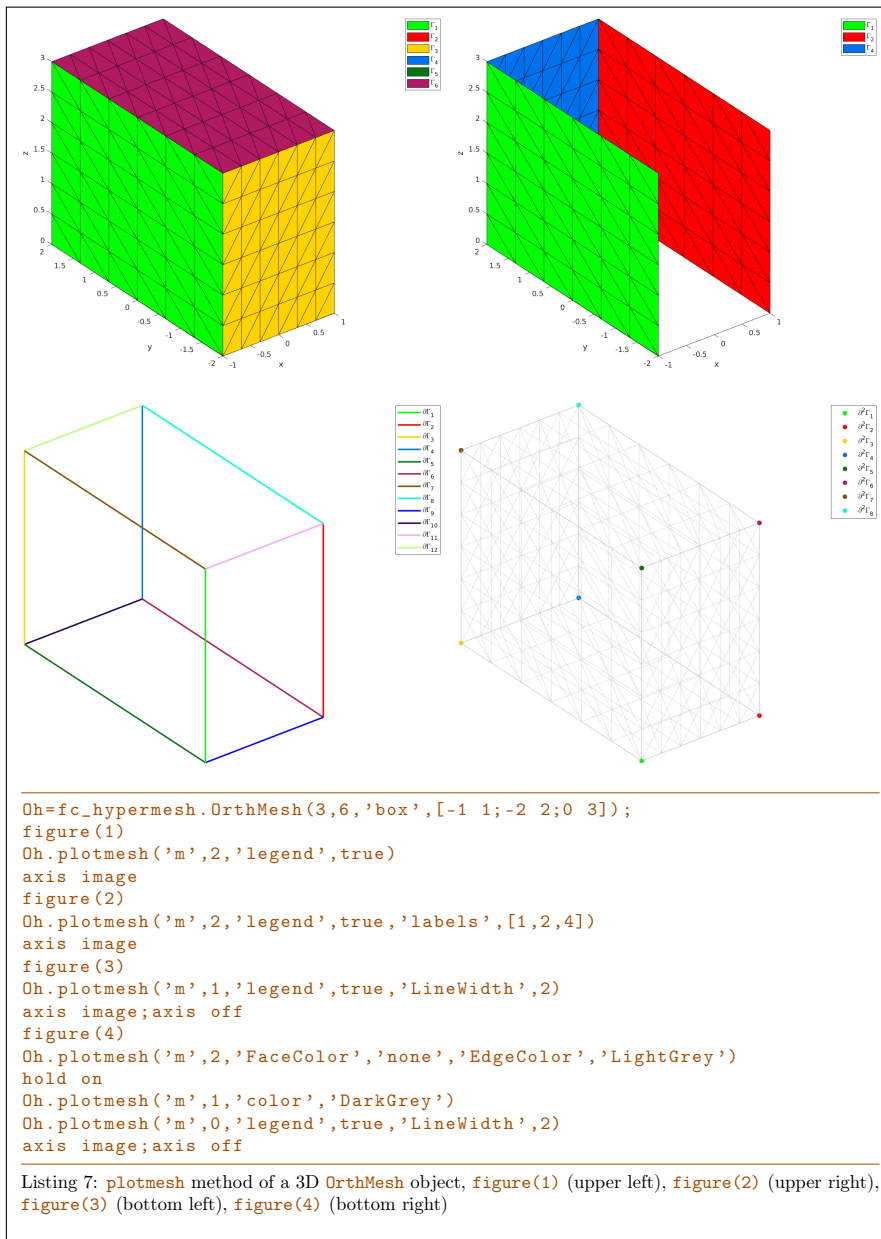

```

Oh1=fc_hypermesh.OrthMesh(3,6,'box',[-1 1;-2 2;0 3]);
figure(1)
Oh1.plotmesh()
axis image
Oh2=fc_hypermesh.OrthMesh(3,6,'type','orthotope');
figure(2)
Oh2.plotmesh('Color','Salmon','LineWidth',2)
axis image

```

Listing 6: `plotmesh` method of 3D `OrthMesh` objects tessellated with simplices in `figure(1)` (left) and with orthotopes in `figure(2)` (right)

3.1.4 plotnodes method

The `plotnodes()` member function can be used to represent nodes of the mesh given by an `OrthMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```

obj.plotnodes()
obj.plotnodes(key, value, ...)

```

Description

```
obj.plotnodes()
```

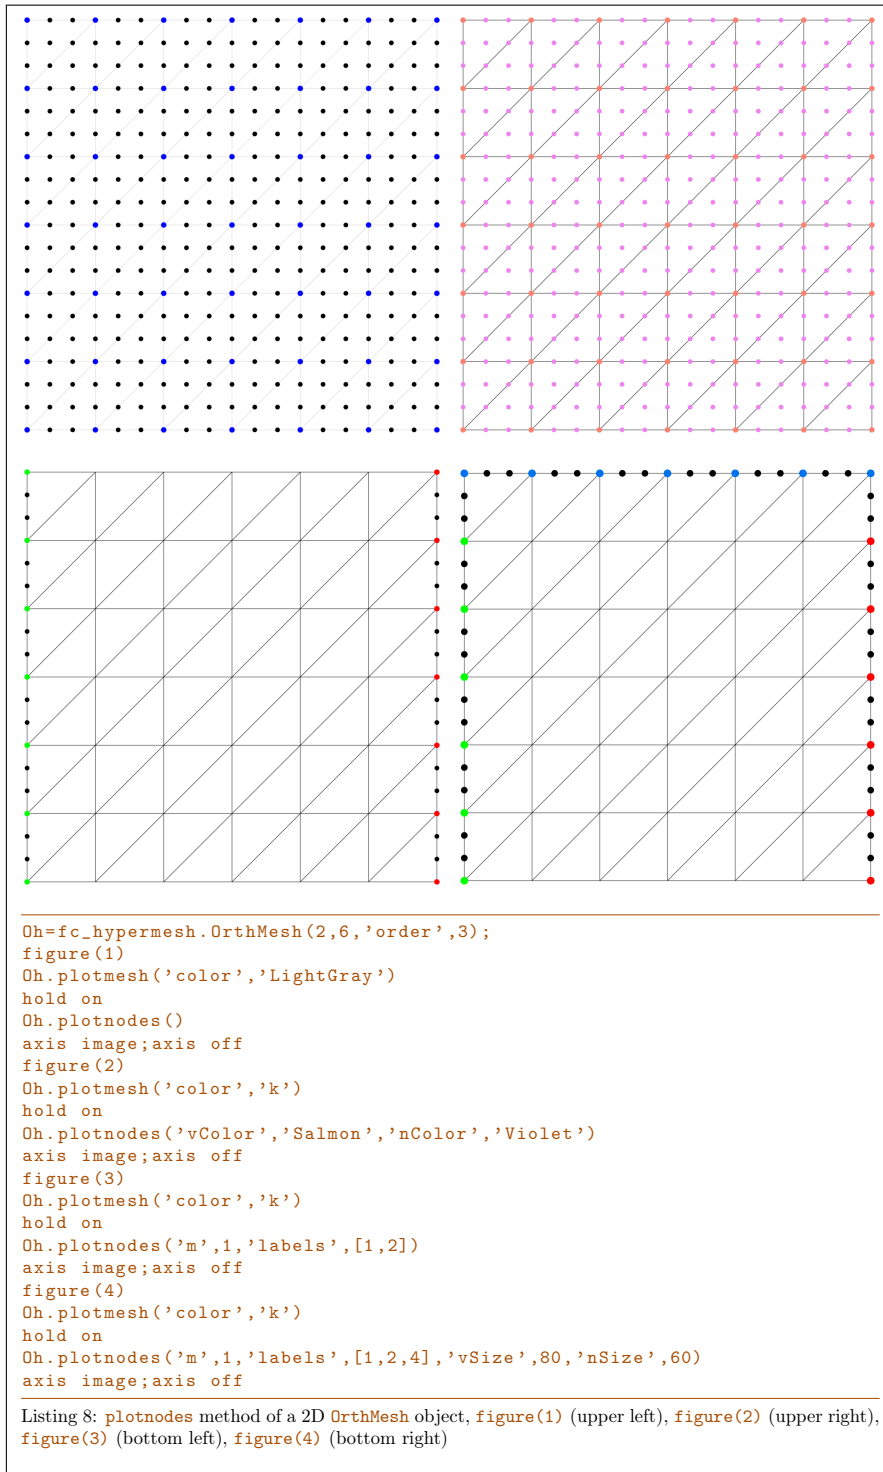

Uses `scatter` function (1D and 2D) and `scatter3` function (3D) to represent nodes of the mesh as points. Vertices of the mesh elements are also nodes and they are distinguishable from others nodes.

```
obj.plotnodes(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'m'` : plots all the nodes of the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- `'labels'` : plot all the nodes of the `m`-faces of the mesh with number/label in `value` list
- `'vcolor'` : use to specify the point color for the mesh vertices. Default is `obj.color`.
- `'vsize'` : use to specify the point size for the mesh vertices. Default is `40`.
- `'ncolor'` : use to specify the color of the nodes (not vertices) of the mesh elements. Default is `'k'` (ie. black).
- `'nsize'` : use to specify the size of the nodes (not vertices) of the mesh elements. Default is `30`.

Other `key/value` pairs arguments can be used: they are those of the `scatter` and `scatter3` function used.

3.1.5 plotnodesNumber method

The `plotnodesNumber()` member function can be used to display nodes index/number of the mesh given by an `OrtMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```
obj.plotnodesNumber()  
obj.plotnodesNumber(key, value, ...)
```

Description

```
obj.plotnodesNumber()
```

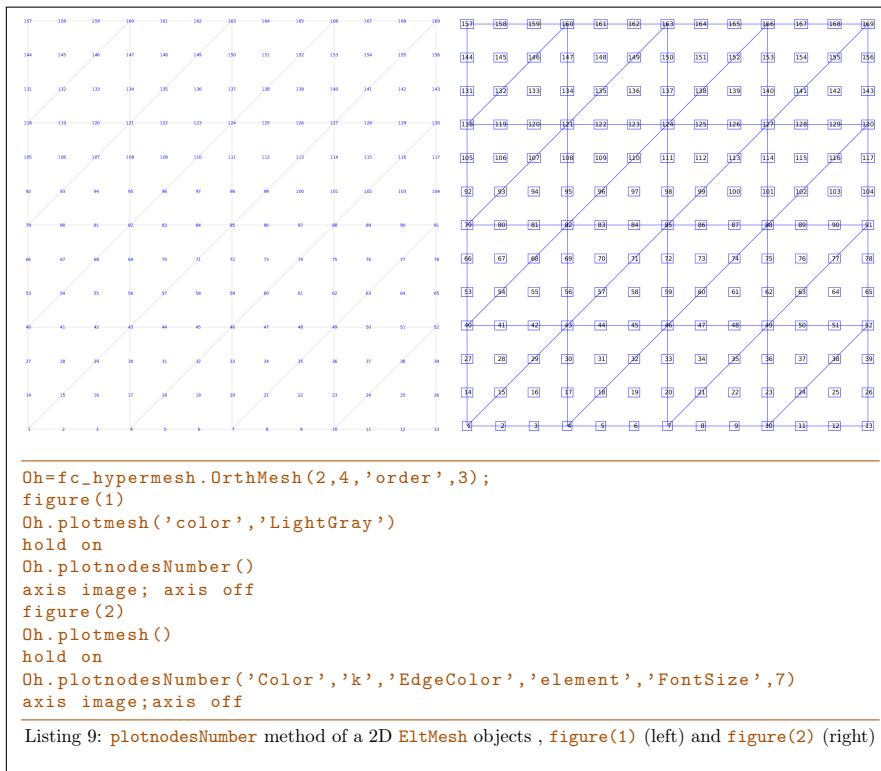

Uses `fc_hypermesh.plotnodesNumber` function to represent node numbers.

```
obj.plotnodesNumber(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'m'` : plots all the nodes index/number of the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- `'labels'` : plot all the nodes index/number of the `m`-faces of the mesh with number/label in `value` list
- `'color'` : use to specify text color. Default is the color element.
- `'EdgeColor'` : use to specify the color of box outline. Default is `'none'` (i.e. no box outline).
- `'BackgroundColor'` : use to specify text background color. Default is `'w'` (i.e. white).
- `'margin'` : use to specify the margin. Default is `1`.
- `'HorizontalAlignment'` : Default is `'center'`.
- `'VerticalAlignment'` : Default is `'middle'`.
- `'clipping'` : Default is `'on'`.

Other `key/value` pairs arguments can be used: they are those of the `text` function used. For the color options `'Color'`, `'EdgeColor'` and `'BackgroundColor'`, one can use `'element'` as `value` to set color to the element color.

3.1.6 `ploteltsNumber` method

The `ploteltsNumber()` member function can be used to display elements index/number of the mesh given by an `OrthMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```

obj.ploteltsNumber()
obj.ploteltsNumber(key, value, ...)

```

Description

```
obj.ploteltsNumber()
```

Uses `fc_hypermesh.ploteElementsNumber` function to represent node numbers.

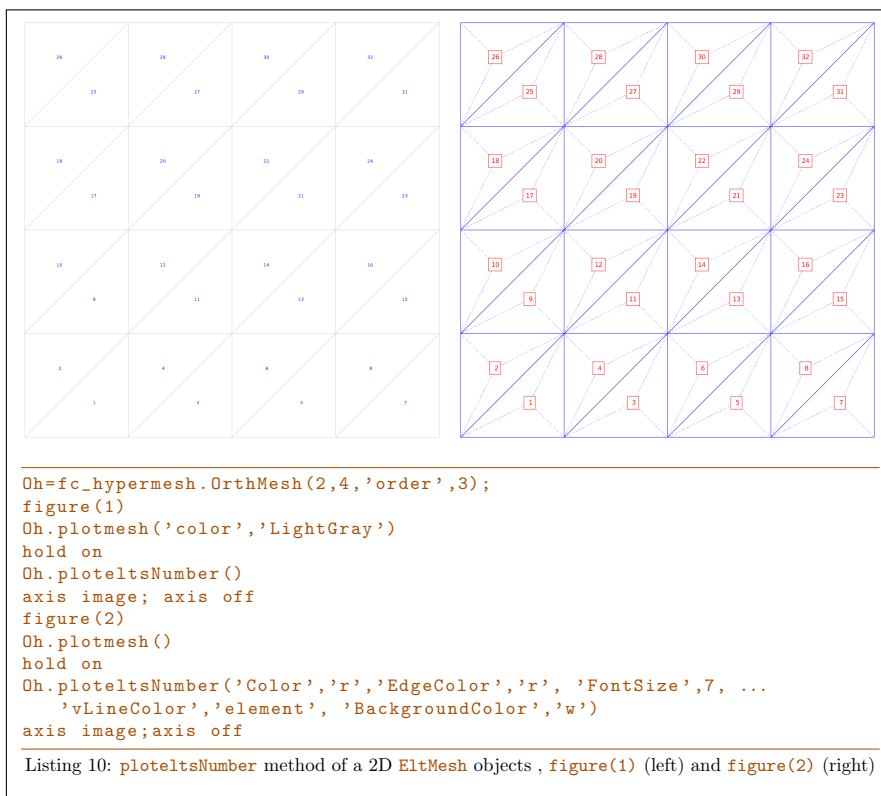

```
obj.ploteltsNumber(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'m'` : plots all the elements index/number of the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- `'labels'` : plot all the elements index/number of the `m`-faces of the mesh with number/label in `value` list.

- `'color'` : use to specify text color. Default is the color element.
- `'EdgeColor'` : use to specify the color of box outline. Default is `'none'` (i.e. no box outline).
- `'BackgroundColor'` : use to specify text background color. Default is `'w'` (i.e. white).
- `'margin'` : use to specify the margin. Default is `1` .
- `'HorizontalAlignment'` : Default is `'center'` .
- `'VerticalAlignment'` : Default is `'middle'` .
- `'clipping'` : Default is `'on'` .
- `'vLineColor'` : Draw lines between vertices and barycenter of the mesh elements. Default is `''` (no lines).
- `'vLineStyle'` : Select lines type. Default is `':'` (dotted lines).
- `'vLineWidth'` : Set lines width. Default is `0.5` .

Other `key/value` pairs arguments can be used: they are those of the `text` function used. For the color options `'Color'`, `'EdgeColor'`, `'BackgroundColor'` and `'vLineColor'`, one can use `'element'` as `value` to set color to the element color.

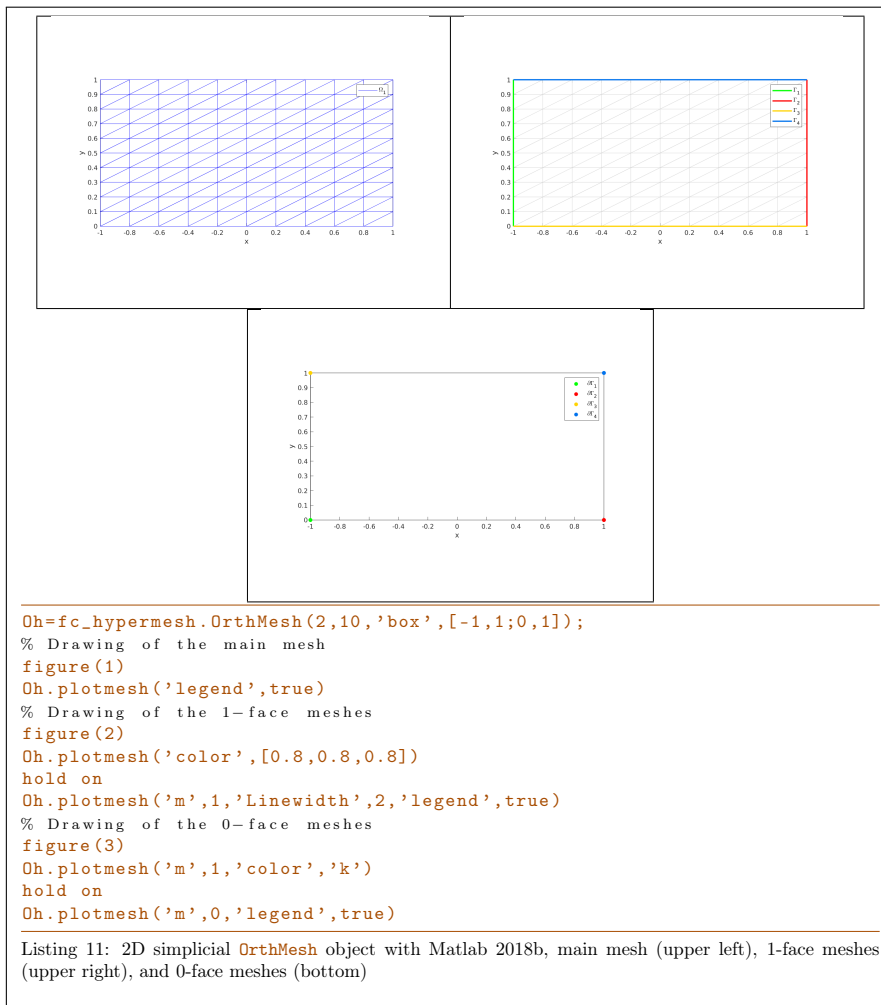

3.2 2d-orthotope meshed by simplices

In Listing 1, an `OrthMesh` object is built under Matlab by using command

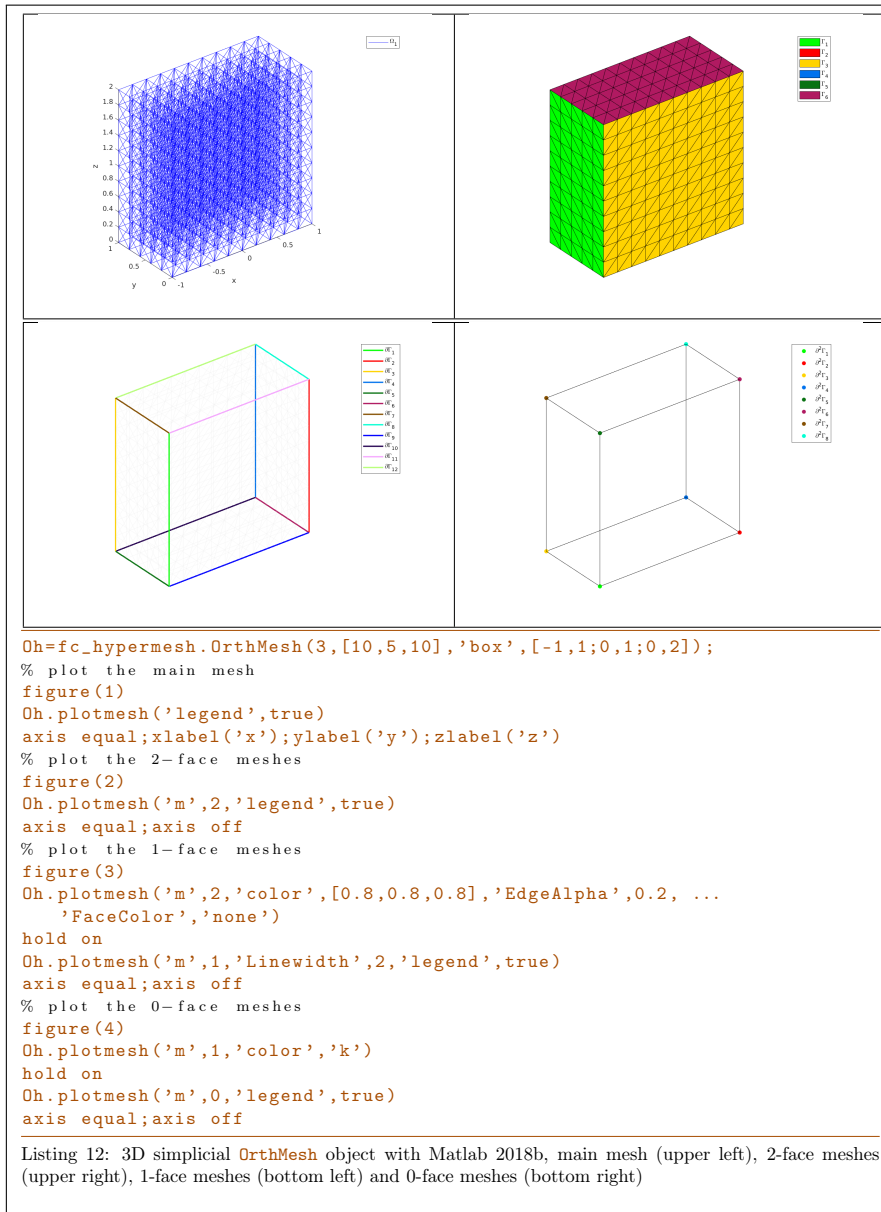

```
Oh=fc_hypermesh.OrthMesh(2,10,'box',[-1,1;0,1]);
```

So the `Oh` object is the tessellations of the orthotope $[-1, 1] \times [0, 1]$ with simplicial elements. In each direction $10 + 1 (= 11!)$ points are taken. So we have 11^2 vertices in this mesh. The main mesh and all the `m`-face meshes of the resulting object are plotted by using `plotmesh` method.

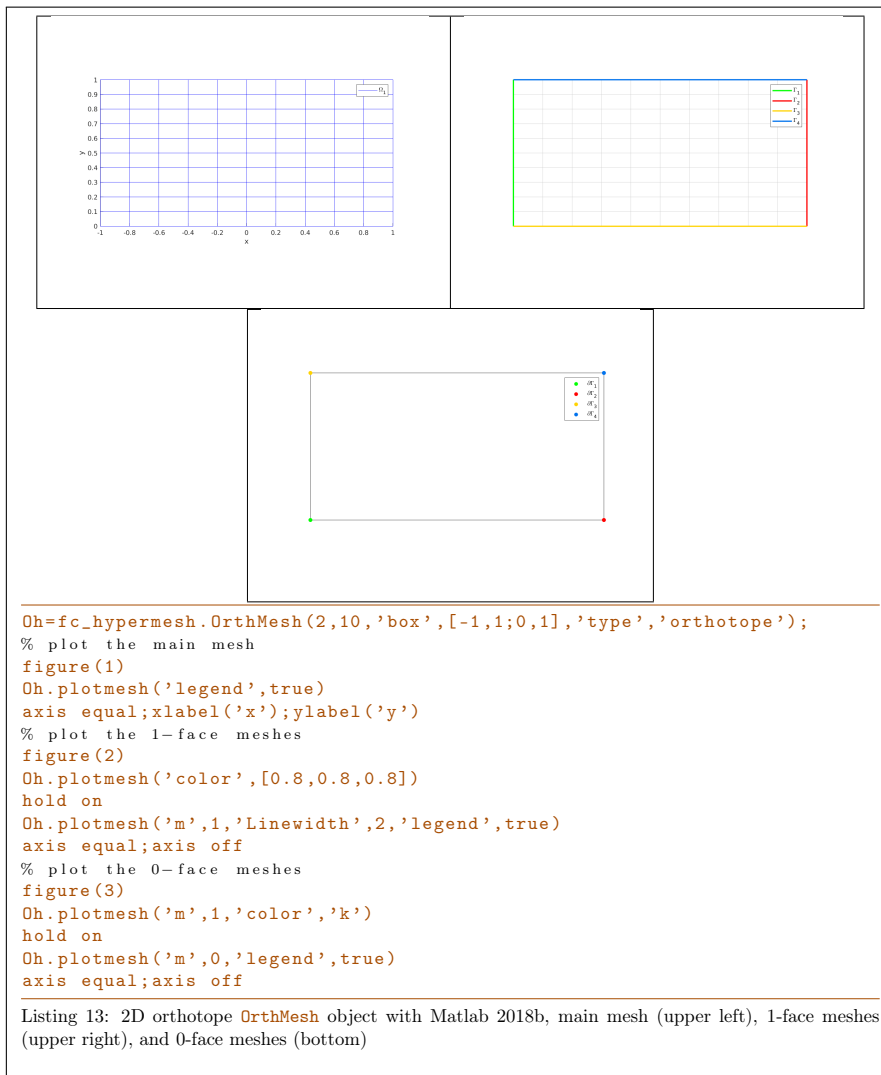

3.3 3d-orthotope meshed by simplices

In Listing 1, an `OrthMesh` object is built under Matlab for the orthotope $[-1, 1] \times [0, 1] \times [0, 2]$ with simplicial elements and $N=[10, 5, 10]$. The main mesh and all the `m`-face meshes of the resulting object are plotted.

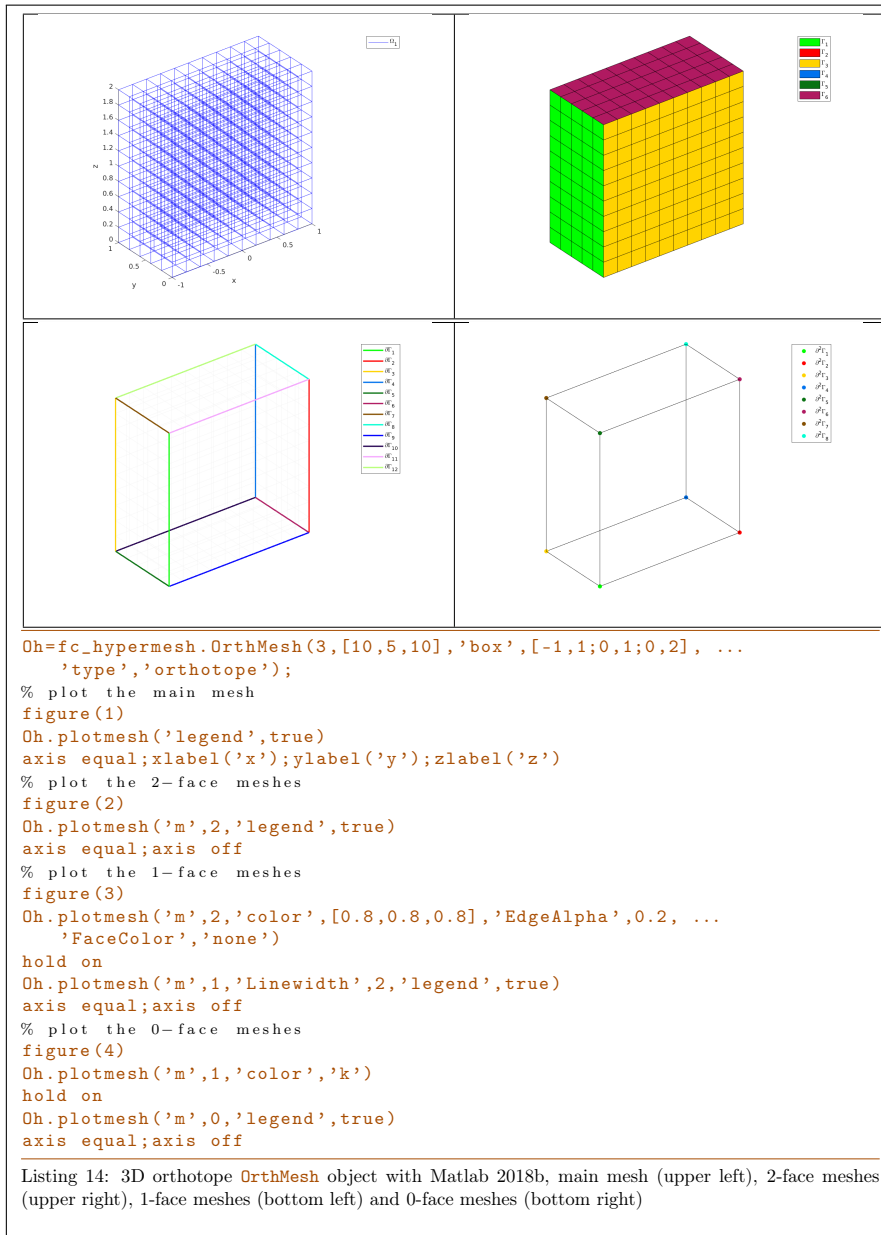

3.4 2d-orthotope meshed by orthotopes

In Listing 1, an `OrthMesh` object is built under Matlab for the orthotope $[-1, 1] \times [0, 1] \times [0, 2]$ with orthotope elements and $\mathbf{N}=[10, 5, 10]$. The main mesh and all the `m`-face meshes of the resulting object are plotted.

3.5 3d-orthotope meshed by orthotopes

In Listing 1, an `OrthMesh` object is built under Matlab for the orthotope $[-1, 1] \times [0, 1] \times [0, 2]$ with orthotope elements and $N=[10, 5, 10]$. The main mesh and all the `m`-face meshes of the resulting object are plotted.

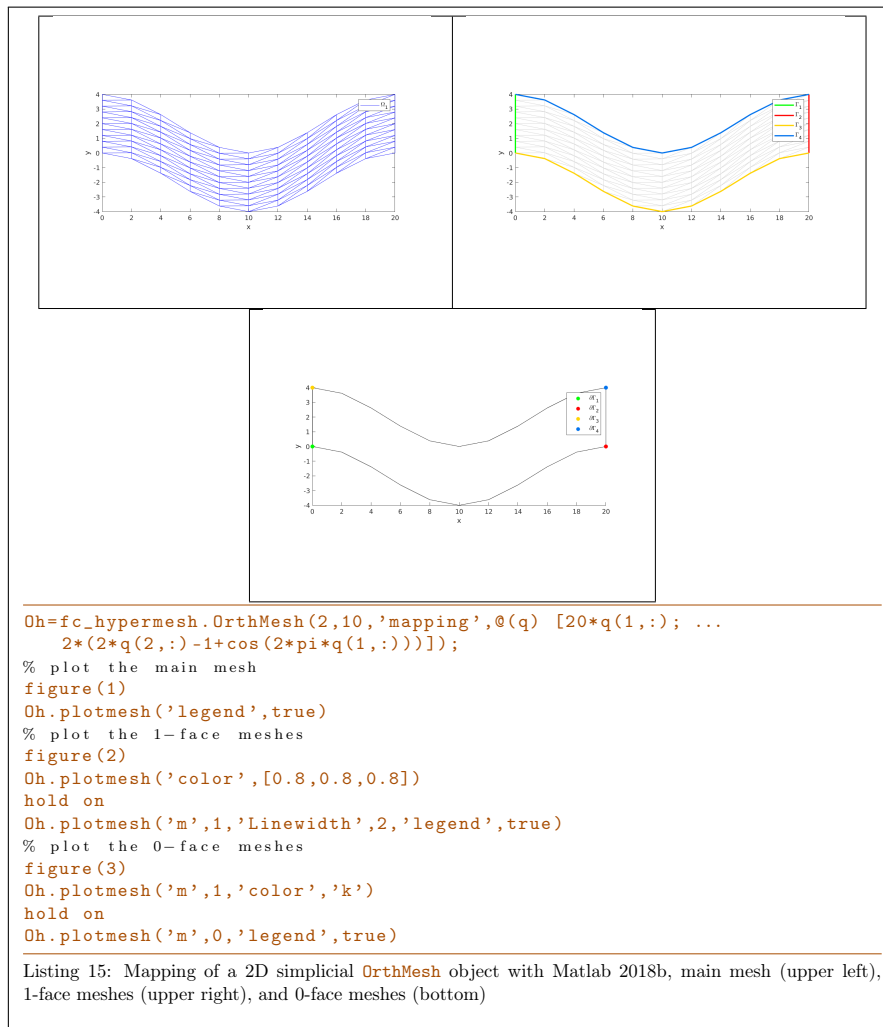

3.6 Mapping of a 2d-orthotope meshed by simplices

For example, the following 2D geometrical transformation allows to deform the reference unit hypercube.

$$[0, 1] \times [0, 1] \longrightarrow \mathbb{R}^2$$

$$\begin{pmatrix} x \\ y \end{pmatrix} \longrightarrow F(x, y) = \begin{pmatrix} 20x \\ 2(2y - 1 + \cos(2\pi x)) \end{pmatrix}$$

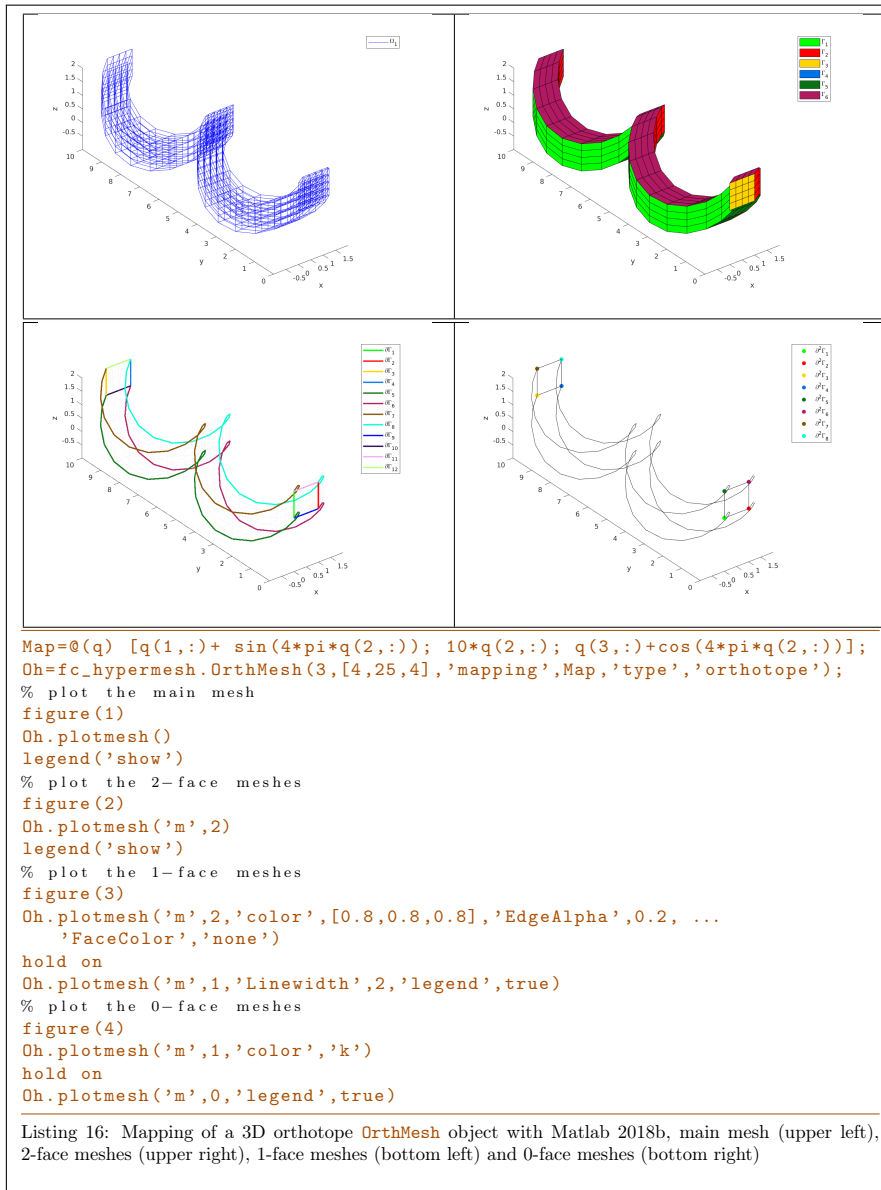

3.7 3d-orthotope meshed by orthotopes

For example, the following 3D geometrical transformation allows to deform the reference unit hypercube.

$$[0, 1] \times [0, 1] \times [0, 1] \longrightarrow \mathbb{R}^2$$

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} \longrightarrow F(x, y, y) = \begin{pmatrix} x + \sin(4\pi y) \\ 10y \\ z + \cos(4\pi y) \end{pmatrix}$$

4 Benchmarking

4.1 `fc_hypermesh.bench` function

The `fc_hypermesh.bench` function can be used to obtain computational times of the `OrthMesh` constructor.

Syntaxe

```
fc_hypermesh.bench(d, LN)
fc_hypermesh.bench(d, LN, key, value, ...)
```

Description

```
fc_bench.bench(d, LN)
```

displays computationnal times of the `OrthMesh` constructor tessellated with simplices (default) as follows

```
ts=tic();Oh=fc_hypermesh.OrthMesh(d, LN(:, i); tcpu=toc(ts);
```

for each `i` in `1:size(LN, 2)`.

- `d`, space dimension.
- `LN` is either a 1-by-`n` or a `d`-by-`n` array of positive integers.

```
fc_bench.bench(d, LN, key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'type'` : string `'simplex'` (default) or `'orthotope'` to specify kind of tessellation.
- `'order'` : positive integer (1 by default) to specify order of the mesh elements.
- `'box'` : `d`-by-2 array of double

4.2 Examples

Listing 17: : Computational times of `OrthMesh` constructor in dimension `d=3` where mesh elements are 1-order simplices

```
fc_hypermesh.bench(3, 25:25:175, 'box', [-1 1; -1 1; -1 1], 'type', 'simplex')
```

Output

```
# BENCH in dimension 3 with simplex mesh
#d: 3
#order: 1
#type: simplex
#box: [ -1 1; -1 1; -1 1]
#desc:  N      nq      nme time(s)
      25    17576    93750  0.434

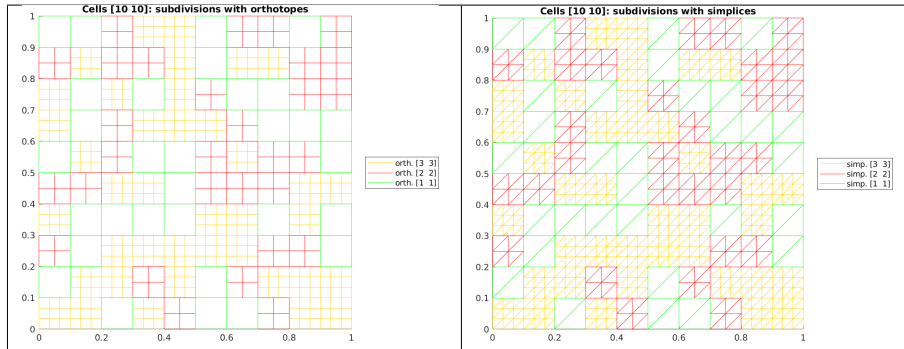

Figure 9: regular refinement of a 2D-grid with orthotopes (left) and simplices (right)

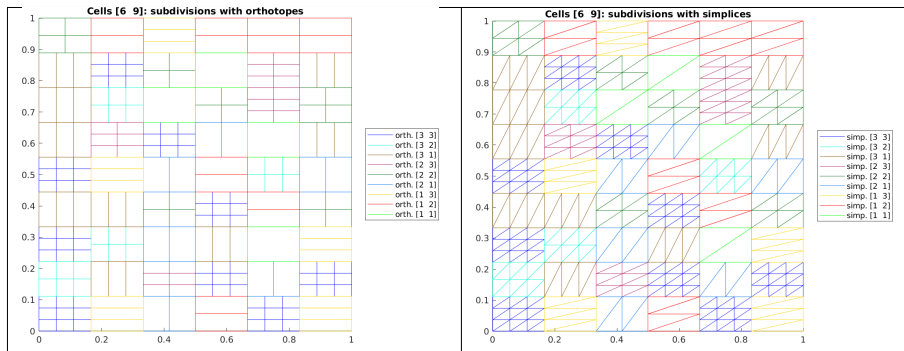

Figure 10: no regular refinement of a 2D-grid with orthotopes (left) and simplices (right)

5 Mesh refinement

5.1 Non-conforming mesh refinement

In this part we propose a preliminary refinement of a regular d -grid. We want to generate a refinement of some cells of this regular grid with d -simplices and/or d -orthotopes: the mesh obtained is therefore non-conforming.

In Figure 9, a 2D-grid with 10-by-10 cells is refined with regular subcells (i.e. same number of discretisation in each directory) made of simplices or orthotopes. For example a cell subdivided in 3-by-3 orthotopes is denoted by `orth[3 3]` and this same cell subdivided in 3-by-3 simplices (in fact $3 \times 3 \times 2$ simplices) is denoted by `simp[3 3]`. In Figure 10, a 2D-grid with 10-by-10 cells (left) and with 6-by-9 cells (right) is refined with subcells (not necessarily with same number of discretisation in each directory). In Figure 11, a 2D-grid with 10-by-10 cells (left) is refined with regular subcells made of orthotopes or simplices. On the right, a 2D-grid with 6-by-9 cells is refined with not necessarily regular subcells made of orthotopes or simplices refined with subcells respectively.

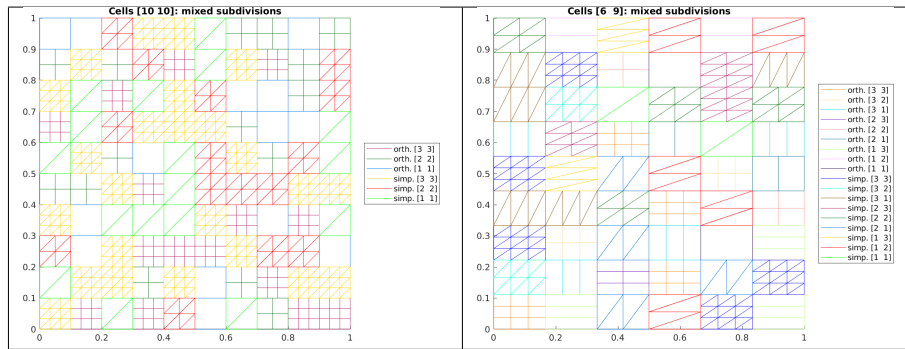

Figure 11: Regular (left) and not regular (right) refinement of a 2D-grid with orthotopes and simplices

5.1.1 Refinement function

The refinement of an `OrthMesh` object whose elements are orthotopes is obtained by using the `fc_hypermesh.refinement.refine` Matlabfunction.

```
scs = refine(Oh, ndiscells)
scs = refine(Oh, ndiscells, type)
scs = refine(Oh, ndiscells, types)
```

This function returns cells array of structures. Each array entry contains all cells refined with a `type` of element (simplicial or orthotope) and selected numbers of discretisation in each axis direction. Each structure (called *subcells structure*) has the fields

- `d`: space dimension
- `type`: `type` of element: `'simplicial'` or `'orthotope'`
- `n`: 1-by-`d` array corresponding to selected numbers of discretisation in each axis direction
- `nq`: number of vertices
- `nme`: number of mesh elements
- `q`: `d`-by-`nq` vertices array
- `me`: `p`-by-`nme` connectivity array ($p = d + 1$ for simplices and $p = 2^d$ for orthotopes)
- `ncell`: contains all the number of the cells grid which are refined.

Description

```
scs = fc_hypermesh.refinement.refine(Oh,ndiscells)
```

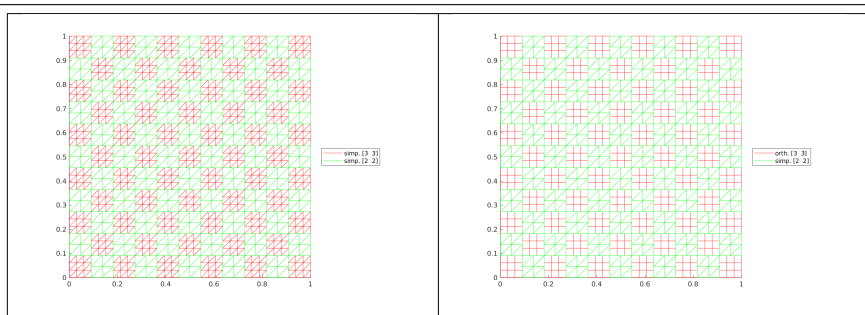

The first input `Oh` is an `OrthMesh` object whose elements are orthotopes. `ndiscells` is an 1-by-`Oh.Mesh.nme` array (for regular refinement) or a `d`-by-`Oh.Mesh.nme` array. `ndiscells(:,k)` are the numbers of discretisation in each axis direction. The output is a cells array of *subcells structure* where a all subcells `type` are `'orthotope'`

```
scs = fc_hypermesh.refinement.refine(Oh,ndiscells,type)
```

Same as previous one if `type` is `'orthotope'`. Otherwise `type` is `'simplicial'` and all subcells `type` of the output are `'simplicial'`

```
[scsimp,scorth] = fc_hypermesh.refinement.refine(Oh,ndiscells,types)
```

The input `types` is an 1-by-`Oh.Mesh.nme` array: if `types(k)` is equal to 0 then the k -th mesh element (cell) of the `OrthMesh` is refined with simplices otherwise with orthotopes.

```
d=2; % space dimension
N=11; % or N=[10,10]
Oh=fc_hypermesh.OrthMesh(d,N,'type','orthotope');
nme=Oh.Mesh.nme; % Number of Mesh elements
ndiscells=2*ones(1,nme);
ndiscells(1:2:nme)=3;
sc1=fc_hypermesh.refinement.refine(Oh,ndiscells,'simplex');
figure(1)
fc_hypermesh.refinement.plotsubcells(sc1)
set(legend(),'Location','eastoutside');axis image

types=zeros(1,nme);ndiscells=2*ones(1,nme);
types(1:2:nme)=1;ndiscells(1:2:nme)=3;
sc2=fc_hypermesh.refinement.refine(Oh,ndiscells,types);
figure(2)
fc_hypermesh.refinement.plotsubcells(sc2)
set(legend(),'Location','eastoutside');axis image
```

Listing 21: 2D orthotope `OrthMesh` refinement with Matlab 2018b, figure 1 (left) and figure 2 (right)

- ...
- `fc_hypermesh.refinement.demo10`

Appendices

A Memory consuming

Beware when using these codes of memory consuming : the number of points \mathbf{nq} and the number of elements quickly increase according to the space dimension \mathbf{d} . When meshing a \mathbf{d} -orthotope with \mathbf{p} -order mesh elements by taking N intervals in each space direction, we have a number of nodes given by

$$\mathbf{nq} = (\mathbf{p} * N + 1)^{\mathbf{d}}, \text{ for both tessellation and triangulation}$$

and the number of mesh elements is

$$\begin{aligned} \mathbf{nme} &= N^{\mathbf{d}}, & \text{for tessellation by orthotopes} \\ \mathbf{nme} &= \mathbf{d!}N^{\mathbf{d}}, & \text{for tessellation by simplices.} \end{aligned}$$

If the array \mathbf{q} is stored as *double* (8 bytes) then

$$\text{mem. size of } \mathbf{q} = \mathbf{d} \times \mathbf{nq} \times 8 \text{ bytes}$$

and if the array \mathbf{me} as *int* (4 bytes) then

$$\text{mem. size of } \mathbf{me} = \begin{cases} (\mathbf{p} + 1)^{\mathbf{d}} \times \mathbf{nme} \times 4 \text{ bytes} & \text{(tessellation by orthotopes)} \\ \frac{(\mathbf{d} + \mathbf{p})!}{\mathbf{d!p!}} \times \mathbf{nme} \times 4 \text{ bytes} & \text{(tessellation by simplices)} \end{cases}$$

With $N = 10$, $\mathbf{d} \in \llbracket 1, 8 \rrbracket$ and order $\mathbf{p} = 1$, the values of \mathbf{nq} and \mathbf{nme} are given in Table 5. The memory usage for the corresponding array \mathbf{q} and array \mathbf{me} is available in Table 6. In Table ??, the memory usage for the array \mathbf{q} and array \mathbf{me} for $N = 10$, $\mathbf{d} = 3$ and order $\mathbf{p} \in \llbracket 1, 8 \rrbracket$.

\mathbf{d}	$\mathbf{nq} = (N + 1)^{\mathbf{d}}$	$\mathbf{nme} = N^{\mathbf{d}}$ (orthotopes)	$\mathbf{nme} = \mathbf{d!}N^{\mathbf{d}}$ (simplices)

B Low level codes

B.1 Class object `EltMesh`

The elementary mesh class object called `EltMesh` is used to store only one mesh, the main mesh as well as any of the **m**-face meshes. This class `EltMesh` also simplifies (for me) the codes writing and its fields are the following:

- **d**, space dimension
- **m**, kind of mesh ($m = d$ for the main mesh), tessellated with **m**-simplices or **m**-orthotopes.
- **order**, order **p** of the mesh elements
- **type**, 0 for simplicial mesh or 1 for orthotope mesh
- **nq**, number of nodes
- **q**, nodes array of dimension **d**-by-**nq**
- **nme**, number of mesh elements

- `me`, connectivity array of dimension $\frac{(d+p)!}{d!p!}$ -by-`nme` for `p`-order simplices elements or $(p+1)^d$ -by-`nme` for `p`-order orthotopes elements
- `toGlobal`, index array linking local array `q` to the one of the main mesh
- `label`, name/number of this elementary mesh
- `color`, color of this elementary mesh (for plotting purpose)

B.1.1 Constructor

```
Eh = fc_hypermesh.EltMesh(m,q,me)
Eh = fc_hypermesh.EltMesh(m,q,me, ...
    key,value,...)
```

Description

```
Eh = fc_hypermesh.EltMesh(m,q,me)
```

Generates the `EltMesh` object `Eh` which contains a 1-order `m`-simplicial mesh by default. The space dimension `d` is `size(q,1)`.

- `m`, kind of mesh: tessellated with `m`-simplices.
- `q` is the nodes array of dimension `d`-by-`nq`.
- `me` is the connectivity array of dimension $(d+1)$ -by-`nme` corresponding to 1-order simplices elements.

Listing 22: `EltMesh` constructor in dimension `d=2` (simplicial mesh)

```
[q,me]=fc_hypermesh.CG.TessSim(10^3*ones(1,2));
Eh=fc_hypermesh.EltMesh(2,q,me)
```

Output

```
Eh =
EltMesh object
  type : simplex
  order : 1
    d : 2
    m : 2
    q : (2,1002001)
    me : (3,2000000)
```

```
Eh = fc_hypermesh.EltMesh(m,q,me, key,value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'type'` : used to select the kind of elements used. The default `value` is `'simplex'` and otherwise `'orthotope'` can be used.
- `'order'` : gives the order of the mesh elements (default is 1).

Listing 23: `EltMesh` constructor in dimension `d=3` (orthotope mesh)

```
[q,me]=fc_hypermesh.CG.TessHyp(3:5,2);  
Eh=fc_hypermesh.EltMesh(3,q,me,'type','orthotope','order',2)
```

Output

```
Eh =  
  
EltMesh object  
  type : orthotope  
  order : 2  
  d : 3  
  m : 3  
  q : (3,693)  
  me : (27,60)
```

B.1.2 `plotmesh` method

The `plotmesh()` member function can be used to represent the mesh given by an `EltMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```
obj.plotmesh()  
obj.plotmesh(key, value, ...)
```

Description

```
obj.plotmesh()
```

```
obj.plotmesh(key, value, ...)
```

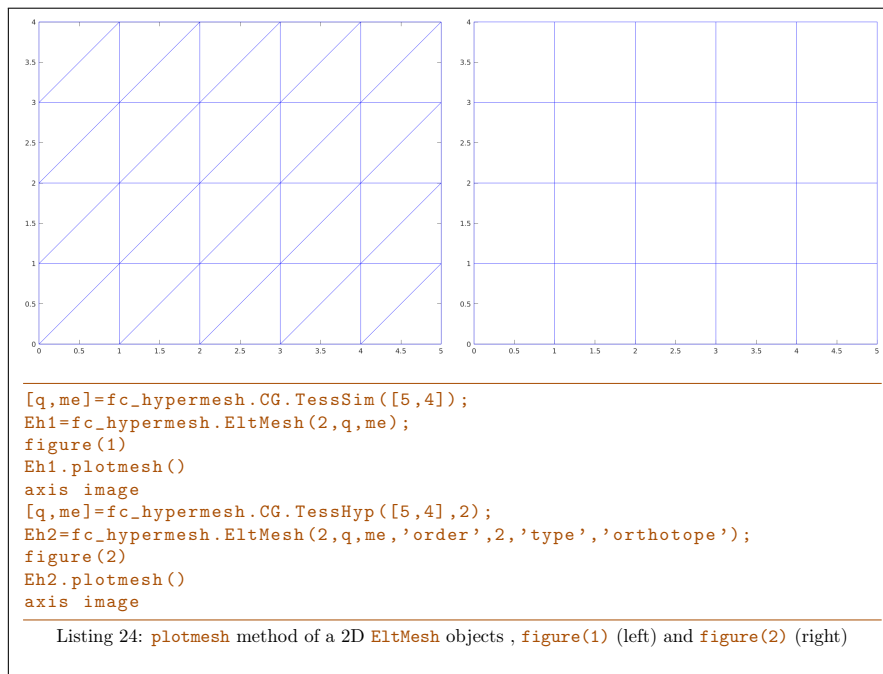

Some optional `key/value` pairs arguments are available with `key`:

- `'color'` : use to specify the color of the mesh. Otherwise `obj.color` is used.

Other `key/value` pairs arguments can be used depending of `obj.d` and `obj.m` values and they are those of the plotting function used:

- with `obj.d=3` and `obj.m=3`, `patch` function is used;
- with `obj.d=3` and `obj.m=2`, `trimesh` function is used for simplicial mesh and `patch` function is used for orthotope mesh;
- with `obj.d=3` and `obj.m=1`, `line` function is used;
- with `obj.d=3` and `obj.m=0`, `scatter3` function is used;
- with `obj.d=2` and `obj.m=2`, `triplot` function is used for simplicial mesh and `patch` function is used for orthotope mesh;
- with `obj.d=2` and `obj.m=1`, `line` function is used;
- with `obj.d=2` and `obj.m=0`, `scatter` function is used;

- with `obj.d=1` and `obj.m=1`, `line` function is used;
- with `obj.d=1` and `obj.m=0`, `scatter` function is used;

B.1.3 `plotnodes` method

The `plotnodes()` member function can be used to represent nodes of the mesh given by an `EltMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```

obj.plotnodes()
obj.plotnodes(key, value, ...)

```

Description

```

obj.plotnodes()

```

Uses `scatter` function (1D and 2D) and `scatter3` function (3D) to represent nodes of the mesh as points. Vertices of the mesh elements are also nodes and they are distinguishable from others nodes.

```

obj.plotnodes(key, value, ...)

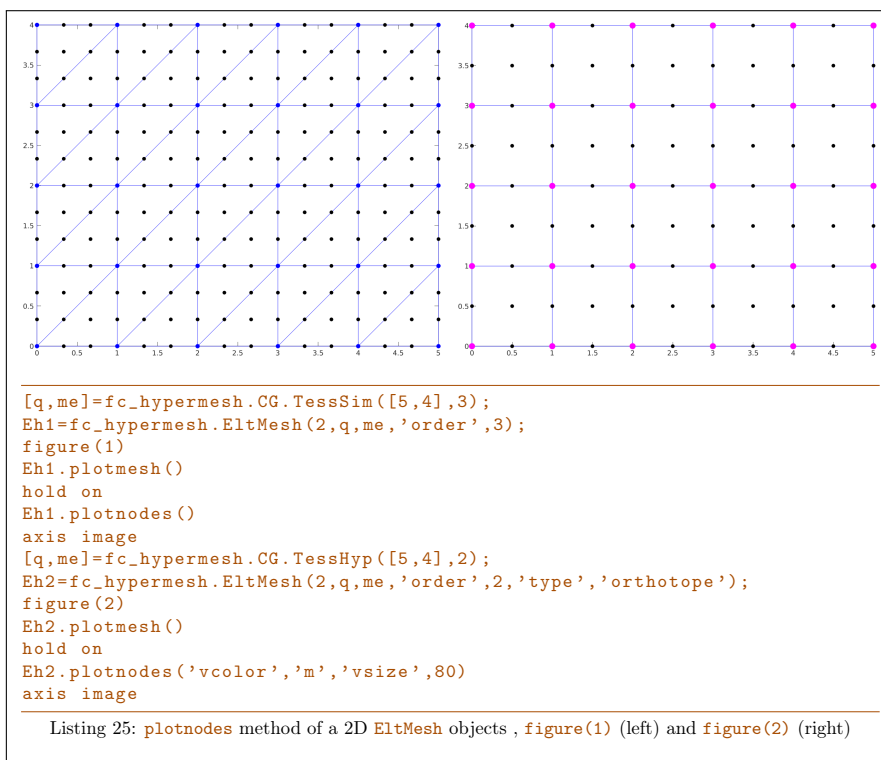

```

Some optional `key/value` pairs arguments are available with `key`:

- `'vcolor'`: use to specify the point color for the mesh vertices. Default is `obj.color`.

- `'vsize'` : use to specify the point size for the mesh vertices. Default is 40 .
- `'ncolor'` : use to specify the color of the nodes (not vertices) of the mesh elements. Default is `'k'` (ie. black).
- `'nsize'` : use to specify the size of the nodes (not vertices) of the mesh elements. Default is 30 .

Other `key/value` pairs arguments can be used: they are those of the `scatter` and `scatter3` function used.

B.1.4 `plotnodesNumber` method

The `plotnodesNumber()` member function can be used to display node numbers of the mesh given by an `EltMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```

obj.plotnodesNumber()
obj.plotnodesNumber(key, value, ...)

```

Description

```
obj.plotnodes()
```

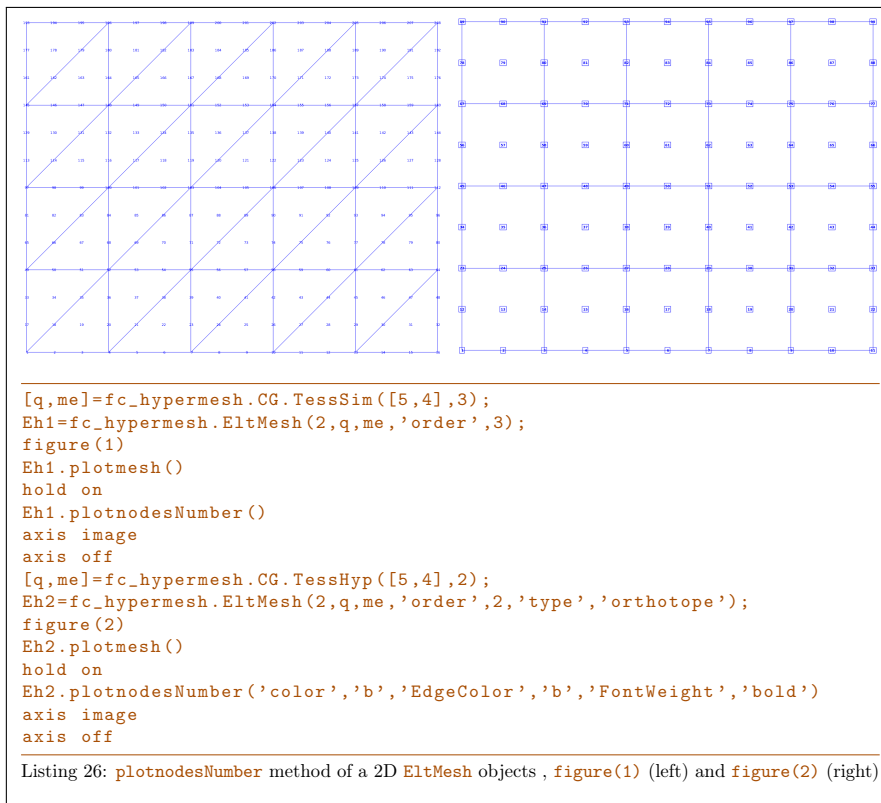

Uses `fc_hypermesh.plotnodesNumber` function to represent node numbers.

```
obj.plotnodes(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'BackgroundColor'` : use to specify text background color. Default is `'w'` (i.e. white).
- `'margin'` : use to specify the margin. Default is `1` .
- `'HorizontalAlignment'` : Default is `'center'` .
- `'VerticalAlignment'` : Default is `'middle'` .
- `'clipping'` : Default is `'on'` .

Other `key/value` pairs arguments can be used: they are those of the `text` function used.

B.1.5 `ploteltsNumber` method

The `ploteltsNumber()` member function can be used to display element numbers of the mesh given by an `EltMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```
obj.ploteltsNumber()  
obj.ploteltsNumber(key, value, ...)
```

Description

```
obj.ploteltsNumber()
```

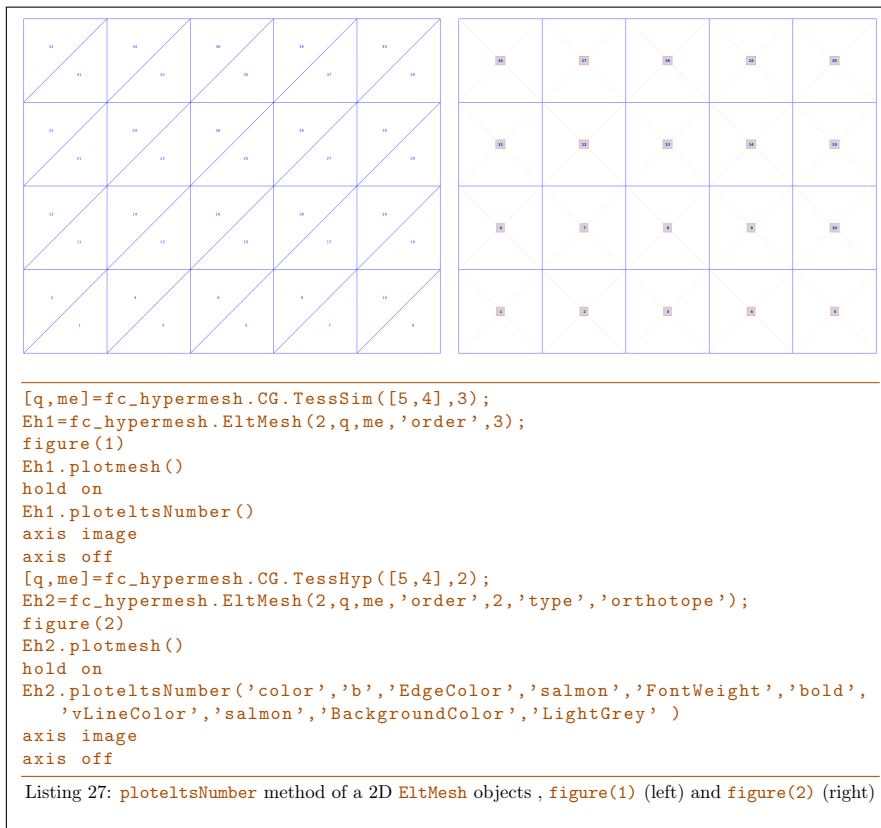

Uses `fc_hypermesh.ploteElementsNumber` function to represent node numbers.

```
obj.ploteltsNumber(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'Color'` : use to specify text color. Default is `'r'` (i.e. red).
- `'BackgroundColor'` : use to specify text background color. Default is `'w'` (i.e. white).
- `'margin'` : use to specify the margin. Default is `1`.
- `'HorizontalAlignment'` : Default is `'center'`.
- `'VerticalAlignment'` : Default is `'middle'`.
- `'clipping'` : Default is `'on'`.
- `'vLineColor'` : Draw lines between vertices and barycenter of the mesh elements. Default is `''` (no lines).
- `'vLineStyle'` : Select lines type. Default is `':'` (dotted lines).
- `'vLineWidth'` : Set lines width. Default is `0.5`.

Other `key/value` pairs arguments can be used: they are those of the `text` function used.
