

fc_{hypermesh} Matlab toolbox, User's Guide*

version 1.0.4

François Cuvelier[†]

March 4, 2023

Abstract

This object-oriented Matlab toolbox allows in any dimension d to generate conforming meshes of hypercubes, hyperrectangles or of any d -orthotopes by p -order simplices or orthotopes with their m -faces. It was created to show the implementation of the algorithms of [1]. The `fchypermesh` toolbox uses Matlab objects and is provided with meshes visualization tools for dimension less than or equal to 3.

1 Introduction

The **Hypermesh** toolbox contains a simple class object **OrthMesh** which permits, in any dimension $d \geq 1$, to obtain conforming mesh of a d -orthotope tessellated with p -order simplices or p -order orthotopes. Corresponding m -faces, $0 \leq m < d$ of the mesh are also provided. The number of m -faces of a d -orthotope is

$$E_m^d \stackrel{\text{def}}{=} 2^{d-m} \binom{d}{m} \quad \text{where} \quad \binom{d}{m} = \frac{d!}{m!(d-m)!} \quad (1)$$

Results and vectorized algorithms used in this toolbox are given in [1].

For dimension 1 to 3 and order 1 to 4, orthotope elements and simplicial elements are respectively represented In Table 1 and Table 2. In older toolbox(0.0.x versions) only order 1 was provided.

| $d \backslash p$ | 1 | 2 | 3 | 4 |
|------------------|---|---|---|---|
| 1 | — | — | — | — |
| 2 | | | | |
| 3 | | | | |

Table 1: p -order d -orthotope mesh element in \mathbb{R}^d . Nodes are the points.

| d | 1 | 2 | 3 | 4 |
|-----|---|---|---|---|
| 1 | | | | |
| 2 | | | | |
| 3 | | | | |

Table 2: p -order d -simplicial mesh element in \mathbb{R}^d . Nodes are the points.

In Figure 1 and Figure 3 small meshes of the unit hypercube are given for both tessellations with 1-order orthotopes and 1-order simplices respectively in dimension 2 and 3. From these meshes, all the associated 2-faces meshes are represented in Figure 2 and Figure 4.

Figure 1: Tessellation samples of $[0, 1]^2$ with 1-order 2-orthotopes (left) and 1-order 2-simplices (right) where nodes (vertices) of all mesh elements are represented by black points.

Figure 2: Representation of all the 1-faces meshes with 1-order 1-orthotopes (left) and 1-order 1-simplices (right) obtained from the tesselation samples of the Figure 1

Figure 3: Tesselation samples of $[0, 1]^3$ with 1-order 3-orthotopes (left) and 1-order 3-simplices (right) where nodes (vertices) of all mesh elements are represented by black spheres.

Figure 4: Representation of all the 2-faces meshes with 1-order 2-orthotopes (left) and 1-order 2-simplices (right) obtained from the tesselation samples of the Figure 3

By taking back the meshes in dimension 2 represented in Figure 1 and Figure 2, but this time using 3-order mesh element give the new meshes represented in Figure 5 and Figure 6.

Figure 5: Tesselation samples of $[0,1]^2$ with 3-order 2-orthotopes (left) and 3-order 2-simplices (right) where nodes of all mesh elements are represented by black (vertices) and grey points.

Figure 6: Representation of all the 1-faces meshes with 3-order 1-orthotopes (left) and 3-order 1-simplices (right) obtained from the tessellation samples of the Figure 5

In dimension 3, meshes represented in Figure 3 and Figure 4 are this time tessellated respectively with 3-order orthotopes and 3-order simplices and represented in Figure 7 and Figure 8.

Figure 7: Tessellation samples of $[0, 1]^3$ with 3-order 3-orthotopes (left) and 3-order 3-simplices (right) where nodes of all mesh elements are represented by black (vertices) and grey spheres.

Figure 8: Representation of all the 2-faces meshes with 3-order 2-orthotopes (left) and 3-order 2-simplices (right) obtained from the tesselation samples of the Figure 7

It is also possible with the method function `plotmesh` of the class object `OrthMesh` to represent a mesh or its m -faces for $d \leq 3$.

This toolbox was only tested on Ubuntu 22.04.1 with Matlab R2022a.

In the following section, the class object `OrthMesh` is presented. Thereafter some warning statements on the memory used by these objects in high dimension are given. Finally computation times for orthotope meshes and simplicial meshes are given in dimension $d \in [1, 5]$.

2 Installation

2.1 Installation automatic, all in one (recommended)

For this method, one just has to get/download the install file

```
mfc_hypermesh_install.m
```

or get it on the dedicated web page. Thereafter, it should be run under Matlab. This command downloads, extracts and configures the *fc-hypermesh* and all the required toolboxes in the current directory.

For example, to install this toolbox in `~/Matlab/toolboxes` directory, one has to copy the file

```
mfc_hypermesh_install.m
```

in the `~/Matlab/toolboxes` directory. Then in a Matlab terminal run the following commands

```
>> cd ~/Matlab/toolboxes
>> mfc_hypermesh_install
```

This is the output of the `mfc_hypermesh_install` command on a Linux computer:

```
arts of the <fc-hypermesh> Matlab toolbox.
Copyright (C) 2016-2023 F. Cuvelier

1- Downloading and extracting the toolboxes
2- Setting the <fc-hypermesh> toolbox
Write in ~/Matlab/toolboxes/fc-hypermesh-full/fc_hypermesh-1.0.4/configure_loc.m ...
3- Using toolboxes :
    ->         fc-tools : 0.0.35
    ->         fc-bench : 0.1.3
*** Using instructions
To use the <fc-hypermesh> toolbox:
addpath('~/Matlab/toolboxes/fc-hypermesh-full/fc_hypermesh-1.0.4')
fc_hypermesh.init()

See ~/Matlab/toolboxes/mfc_hypermesh_set.m
```

The complete toolbox (i.e. with all the other needed toolboxes) is stored in the directory

```
~/Matlab/toolboxes/fc-hypermesh-full
```

and, for each Matlab session, one has to set the toolbox by:

```
>> addpath('~/Matlab/toolboxes/fc-hypermesh-full/mfc-hypermesh-1.0.4')
>> fc_hypermesh.init()
```

To **uninstall**, one just has to delete directory

```
~/Matlab/toolboxes/fc-hypermesh-full
```

2.2 Manual installation

This package uses the `fc_tools` toolbox. So one has to install it as explain in the dedicated web page.

Thereafter, on the `fc_hypermesh` dedicated web page, one can found link to archives (`zip`, `7z` or `tar.gz` format)

- Downloads an archive and extracts it on a folder, for example `~/Matlab/toolboxes`. The toolbox path is `~/Matlab/toolboxes/mfc-hypermesh-1.0.4`
- Adds the toolbox path in Matlab with `addpath` command.
- Verifies that the `fc_tools` and `fc_bench` toolboxes are in the Matlab path. Otherwise, adds them...

3 Using the `fc_hypermesh` toolbox

Before using this class it will be necessary to be aware of the memory used by this one. For example, when meshing a 6-dimensional orthotope with 1-order simplices by taking $N = 10$ intervals in each space direction, gives an `OrthMesh` object using 20 GB in memory. With 3-order simplices, the `OrthMesh` object use 241 GB in memory!

The memory usage for a d -dimensional `OrthMesh` object by taking $N = 10$ intervals in each space direction is given in Table 3 for 1-order elements and in Table 4 for 3-order elements. One can refer to Appendix A for more details.

| <code>d</code> | <code>OrthMesh</code> (orthotopes) | <code>OrthMesh</code> (simplices) |
|----------------|------------------------------------|-----------------------------------|
| 1 | 8 B | 80 B |
| 2 | 688 B | 2 KB |
| 3 | 23 KB | 96 KB |
| 4 | 601 KB | 4 MB |
| 5 | 13 MB | 288 MB |
| 6 | 308 MB | 20 GB |
| 7 | 6 GB | 1 TB |
| 8 | 147 GB | 145 TB |

Table 3: Memory usage of `OrthMesh` object for the tessellation of an orthotope by 1-order orthotopes and by 1-order simplices according to the space dimension `d` and with $N = 10$.

| <code>d</code> | <code>OrthMesh</code> (orthotopes) | <code>OrthMesh</code> (simplices) |
|----------------|------------------------------------|-----------------------------------|
| 1 | 8 B | 160 B |
| 2 | 1 KB | 8 KB |
| 3 | 135 KB | 480 KB |
| 4 | 8 MB | 33 MB |
| 5 | 438 MB | 2 GB |
| 6 | 21 GB | 241 GB |
| 7 | 968 GB | 24 TB |

Table 4: Memory usage of `OrthMesh` object for the tessellation of an orthotope by 3-order orthotopes and by 3-order simplices according to the space dimension `d` and with $N = 10$.

First of all, the main class object `OrthMesh` is presented. Thereafter some usage samples are given.

3.1 Class object OrthMesh

The aim of the `OrthMesh` class object is to efficiently create an object which contains a mesh of a d -orthotope and all its m -face meshes with either p -order orthotopes or p -order simplices. An elementary mesh class object called `EltMesh` is used to store only one mesh, the main mesh as well as any of the m -face meshes. The `EltMesh` class is described in Appendix B.1.

Let the d -orthotope defined by $[a_1, b_1] \times \cdots \times [a_d, b_d]$. The class object `OrthMesh` corresponding to this d -orthotope contains the main mesh and all its m -face meshes, $0 \leq m < d$. Its fields are the following

- d : space dimension
- `type`: string '`simplex`' or '`orthotope`' mesh
- p , order of the mesh elements
- `Mesh`: main mesh as an `EltMesh` object
- `Faces`: cell array of arrays of `EltMesh` objects such that `Faces{1}` is an array of all the $(d-1)$ -face meshes stored as `EltMesh` objects, `Faces{2}` is an array of all the $(d-2)$ -face meshes, and so on
- `box`: a d -by-2 array such that `box(i,1) = a_i` and `box(i,2) = b_i`.

3.1.1 Constructor

```
Oh = fc_hypermesh.OrthMesh(N)
Oh = fc_hypermesh.OrthMesh(d,N)
Oh = fc_hypermesh.OrthMesh(N, key,value,...)
Oh = fc_hypermesh.OrthMesh(d,N, key,value,...)
```

Description

```
Oh = fc_hypermesh.OrthMesh(N)
```

Generates the `OrthMesh` object `Oh` which contains a 1-order simplicial mesh of the unit d -orthotope and all its m -face meshes. `N` is a 1-by- d array used to obtain a regular discretisation with $N(i) + 1$ points in the i -th direction.

```
Oh = fc_hypermesh.OrthMesh(d,N)
```

Generates the `OrthMesh` object `Oh` which contains a 1-order simplicial mesh of the unit d -orthotope and all its m -face meshes.

- d is the space dimension
- `N` is a 1-by- d array used to obtain a regular discretisation with $N(i) + 1$ points in the i -th direction.
If `N` is a positive integer then $N + 1$ points are created in each direction.

```
Oh = fc_hypermesh.OrthMesh(N, key,value, ...)
```

```
Oh = fc_hypermesh.OrthMesh(d,N, key,value, ...)
```

Some optional `key`/`value` pairs arguments are available with `key`:

- '`type`' : used to select the kind of elements used for meshing. The default `value` is '`simplex`' and otherwise '`orthotope`' can be used.

Listing 1: : `OrthMesh` constructor in dimension $d=3$ (orthotope mesh)

```
Oh = fc_hypermesh.OrthMesh(3,10, 'type','orthotope')
```

Output

```
Oh =
Mesh type : orthotope
dimension : 3
order     : 1
nq        : 1331
nme       : 1000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

- `'order'` : gives the order of the mesh elements (default is 1).

Listing 2: : `OrthMesh` constructor in dimension $d=3$ (simplicial mesh)

```
Oh = fc_hypermesh.OrthMesh(3,[10,20,15], 'order',4)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order     : 4
nq        : 202581
nme       : 18000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

- `'box'` : used to specify the d -orthotope $[a_1, b_1] \times \dots \times [a_d, b_d]$ by setting `value` as an d -by-2 array such that $a_i = \text{value}(i, 1)$ and $b_i = \text{value}(i, 2)$.

Listing 3: : `OrthMesh` constructor in dimension $d=3$ (simplicial mesh)

```
Oh = fc_hypermesh.OrthMesh(3,10, 'box',[ -1 1 ; -2 2 ; 0 3])
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order     : 1
nq        : 1331
nme       : 6000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

- `'m_min'` : used to only build the m -Faces for m in $\llbracket m_{\min}, d \rrbracket$. Default `value` is 0.

Listing 4: : `OrthMesh` constructor in dimension $d=3$ (simplicial mesh)

```
Oh = fc_hypermesh.OrthMesh(3,10, 'm_min',2)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order     : 1
nq        : 1331
nme       : 6000
Number of 2-faces : 6
```

- `'mapping'` : used to apply on the mesh a mapping function given by a function handle.

```
Listing 5: : OrthMesh constructor in dimension d=3 (simplicial mesh)
mfun =@(q) [q(1,:)+sin(q(2,:));q(2,:);q(3,:)];
Oh = fc_hypermesh.OrthMesh(3,10, 'mapping',mfun)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order      : 1
nq         : 1331
nme        : 6000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

3.1.2 Access to OrthMesh's fields

In all examples given in this section, `Oh` is the `OrthMesh` object given by

```
Oh = fc_hypermesh.OrthMesh(3,10, 'order',2)
```

Output

```
Oh =
Mesh type : simplex
dimension : 3
order      : 2
nq         : 9261
nme        : 6000
Number of 2-faces : 6
Number of 1-faces : 12
Number of 0-faces : 8
```

It's a 3 dimensional mesh of the unit cube tessellated with 2-order simplices where their vertices are in $(i/10, j/10, k/10)$ for all $(i, j, k) \in \llbracket 0, 10 \rrbracket$. The main mesh given as an `EltMesh` object is `Oh.Mesh`

```
Th=Oh.Mesh
```

Output

```
Th =
EltMesh object
  type : simplex
  order : 2
    d : 3
    m : 3
    q : (3,9261)
    me : (10,6000)
```

The k^{th} m -faces of `Oh` stored as an `EltMesh` object is given by `Oh.Faces{Oh.d-m}(k)`.

```
Fh=Oh.Faces{1}(3)
```

Output

```
Fh =
EltMesh object
  type : simplex
  order : 2
    d : 3
    m : 2
    q : (3,441)
    me : (6,200)
```

One can easily access to each field of an `EltMesh` object (see description in Appendix B.1). For example, to acces the nodes array and the connectivity array of the `Th` `EltMesh` object we do respectively `Th.q` and `Th.me`. We also have the following link between global nodes array `Th.q` and local nodes array `Fh.q`:

```
Th.q(:,Fh.toGlobal)==Fh.q
```

or more generally, for all m in $\llbracket 0, Oh.d \rrbracket$ and for all k in $\llbracket 1, E_m^d \rrbracket$

```
Oh.Mesh.q(:,Oh.Faces{Oh.d-m}(k).toGlobal)==Oh.Faces{Oh.d-m}(k).q
```

where E_m^d is defined in (1).

3.1.3 `plotmesh` method

The `plotmesh()` member function can be used to represent the mesh given by an `OrthMesh` object if the space dimension is less than or equal to 3.

Syntaxe

```
obj.plotmesh()  
obj.plotmesh(key, value, ...)
```

Description

```
obj.plotmesh()
```

```
obj.plotmesh(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'legend'` : if `value` is `True`, a legend is displayed. Default is `False`.
- `'m'` : plots all the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- `'labels'` : plot all the `m`-faces of the mesh with number/label in `value` list
- `'color'` : use to specify the color to use.
- ...

Other `key/value` pairs arguments can be used depending of `obj.d` and `obj.m` values and they are those of the plotting function used:

- with `obj.d=3` and `obj.m=3` , `patch` function is used;
- with `obj.d=3` and `obj.m=2` , `trimesh` function is used for simplicial mesh and `patch` function is used for orthotope mesh;
- with `obj.d=3` and `obj.m=1` , `line` function is used;
- with `obj.d=3` and `obj.m=0` , `scatter3` function is used;
- with `obj.d=2` and `obj.m=2` , `triplot` function is used for simplicial mesh and `patch` function is used for orthotope mesh;
- with `obj.d=2` and `obj.m=1` , `line` function is used;
- with `obj.d=2` and `obj.m=0` , `scatter` function is used;
- with `obj.d=1` and `obj.m=1` , `line` function is used;
- with `obj.d=1` and `obj.m=0` , `scatter` function is used;

```

Oh1=fc_hypermesh.OrthMesh(3,6,'box',[ -1 1;-2 2;0 3]);
figure(1)
Oh1.plotmesh()
axis image
Oh2=fc_hypermesh.OrthMesh(3,6,'type','orthotope');
figure(2)
Oh2.plotmesh('Color','Salmon','LineWidth',2)
axis image

```

Listing 6: `plotmesh` method of 3D `OrthMesh` objects tessellated with simplices in `figure(1)` (left) and with orthotopes in `figure(2)` (right)

3.1.4 `plotnodes` method

The `plotnodes()` member function can be used to represent nodes of the mesh given by an `OrthMesh` object if the space dimension `d` is less than or equal to 3.

Syntax

```

obj.plotnodes()
obj.plotnodes(key, value, ...)

```

Description

`obj.plotnodes()`

Uses `scatter` function (1D and 2D) and `scatter3` function (3D) to represent nodes of the mesh as points. Vertices of the mesh elements are also nodes and they are distinguishable from others nodes.

`obj.plotnodes(key, value, ...)`

Some optional `key/value` pairs arguments are available with `key`:

- '`m`' : plots all the nodes of the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- '`labels`' : plot all the nodes of the `m`-faces of the mesh with number/label in `value` list
- '`vcolor`' : use to specify the point color for the mesh vertices. Default is `obj.color`.
- '`vsize`' : use to specify the point size for the mesh vertices. Default is `40`.
- '`ncolor`' : use to specify the color of the nodes (not vertices) of the mesh elements. Default is '`k`' (ie. black).
- '`nsize`' : use to specify the size of the nodes (not vertices) of the mesh elements. Default is `30`.

Other `key/value` pairs arguments can be used: they are those of the `scatter` and `scatter3` function used.

```

Oh=fc_hypermesh.OrthMesh(2,6,'order',3);
figure(1)
Oh.plotmesh('color','LightGray')
hold on
Oh.plotnodes()
axis image;axis off
figure(2)
Oh.plotmesh('color','k')
hold on
Oh.plotnodes('vColor','Salmon','nColor','Violet')
axis image;axis off
figure(3)
Oh.plotmesh('color','k')
hold on
Oh.plotnodes('m',1,'labels',[1,2])
axis image;axis off
figure(4)
Oh.plotmesh('color','k')
hold on
Oh.plotnodes('m',1,'labels',[1,2,4],'vSize',80,'nSize',60)
axis image;axis off

```

Listing 8: `plotnodes` method of a 2D `OrthMesh` object, `figure(1)` (upper left), `figure(2)` (upper right), `figure(3)` (bottom left), `figure(4)` (bottom right)

3.1.5 `plotnodesNumber` method

The `plotnodesNumber()` member function can be used to display nodes index/number of the mesh given by an `OrthMesh` object if the space dimension `d` is less than or equal to 3.

Syntax

```
obj.plotnodesNumber()
obj.plotnodesNumber(key, value, ...)
```

Description

`obj.plotnodesNumber()`

Uses `fc_hypermesh.plotnodesNumber` function to represent node numbers.

`obj.plotnodesNumber(key, value, ...)`

Some optional `key/value` pairs arguments are available with `key`:

- '`m`' : plots all the nodes index/number of the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- '`labels`' : plot all the nodes index/number of the `m`-faces of the mesh with number/label in `value` list
- '`color`' : use to specify text color. Default is the color element.
- '`EdgeColor`' : use to specify the color of box outline. Default is '`none`' (i.e. no box outline).
- '`BackgroundColor`' : use to specify text background color. Default is '`w`' (i.e. white).
- '`margin`' : use to specify the margin. Default is `1`.
- '`HorizontalAlignment`' : Default is '`center`' .
- '`VerticalAlignment`' : Default is '`middle`' .
- '`clipping`' : Default is '`on`' .

Other `key/value` pairs arguments can be used: they are those of the `text` function used. For the color options '`Color`', '`EdgeColor`' and '`BackgroundColor`', one can use '`element`' as `value` to set color to the element color.

```
Oh=fc_hypermesh.OrthMesh(2,4,'order',3);
figure(1)
Oh.plotmesh('color','LightGray')
hold on
Oh.plotnodesNumber()
axis image; axis off
figure(2)
Oh.plotmesh()
hold on
Oh.plotnodesNumber('Color','k','EdgeColor','element','FontSize',7)
axis image; axis off
```

Listing 9: `plotnodesNumber` method of a 2D `EltMesh` objects , `figure(1)` (left) and `figure(2)` (right)

3.1.6 `ploteltsNumber` method

The `ploteltsNumber()` member function can be used to display elements index/number of the mesh given by an `OrthMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```
obj.ploteltsNumber()  
obj.ploteltsNumber(key, value, ...)
```

Description

```
obj.ploteltsNumber()
```

Uses `fc_hypermesh.plotElementsNumber` function to represent node numbers.

```
obj.ploteltsNumber(key, value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- '`m`' : plots all the elements index/number of the `m`-faces of the mesh. Default `m = d` i.e. the main mesh. ($0 \leq m \leq d$)
- '`labels`' : plot all the elements index/number of the `m`-faces of the mesh with number/label in `value` list.
- '`color`' : use to specify text color. Default is the color element.
- '`EdgeColor`' : use to specify the color of box outline. Default is '`none`' (i.e. no box outline).
- '`BackgroundColor`' : use to specify text background color. Default is '`w`' (i.e. white).
- '`margin`' : use to specify the margin. Default is `1`.
- '`HorizontalAlignment`' : Default is '`center`' .
- '`VerticalAlignment`' : Default is '`middle`' .
- '`clipping`' : Default is '`on`' .
- '`vLineColor`' : Draw lines between vertices and barycenter of the mesh elements. Default is '' (no lines).
- '`vLineStyle`' : Select lines type. Default is '`::`' (dotted lines).
- '`vLineWidth`' : Set lines width. Default is `0.5` .

Other `key/value` pairs arguments can be used: they are those of the `text` function used. For the color options '`Color`', '`EdgeColor`', '`BackgroundColor`' and '`vLineColor`', one can use '`element`' as `value` to set color to the element color.

```

Oh=fc_hypermesh.OrthMesh(2,4,'order',3);

Oh.ploteltsNumber('Color','r','EdgeColor','r', 'FontSize',7, 'vLineColor','element', ...
'BackgroundColor','w')
axis image;axis off

```

Listing 10: `ploteltsNumber` method of a 2D `EltMesh` objects , `figure(1)` (left) and `figure(2)` (right)

3.2 2d-orthotope meshed by simplices

In Listing 1, an `OrthMesh` object is built under Matlab by using command

```
Oh=fc_hypermesh.OrthMesh(2,10,'box',[-1,1;0,1]);
```

So the `Oh` object is the tessellations of the orthotope $[-1, 1] \times [0, 1]$ with simplicial elements. In each direction $10 + 1 (= 11!)$ points are taken. So we have 11^2 vertices in this mesh. The main mesh and all the `m`-face meshes of the resulting object are plotted by using `plotmesh` method.

```

Oh=fc_hypermesh.OrthMesh(2,10, 'box',[ -1,1;0,1]);
% Drawing of the main mesh
figure(1)
Oh.plotmesh('legend',true)
% Drawing of the 1-face meshes
figure(2)
Oh.plotmesh('color',[0.8,0.8,0.8])
hold on
Oh.plotmesh('m',1,'Linewidth',2,'legend',true)
% Drawing of the 0-face meshes
figure(3)
Oh.plotmesh('m',1,'color','k')
hold on
Oh.plotmesh('m',0,'legend',true)

```

Listing 11: 2D simplicial `OrthMesh` object with Matlab 2022a, main mesh (upper left), 1-face meshes (upper right), and 0-face meshes (bottom)

3.3 3d-orthotope meshed by simplices

In Listing 1, an `OrthMesh` object is built under Matlab for the orthotope $[-1, 1] \times [0, 1] \times [0, 2]$ with simplicial elements and $\text{N}=[10, 5, 10]$. The main mesh and all the m -face meshes of the resulting object are plotted.

3.4 2d-orthotope meshed by orthotopes

In Listing 1, an `OrthMesh` object is built under Matlab for the orthotope $[-1, 1] \times [0, 1] \times [0, 2]$ with orthotope elements and `N=[10,5,10]`. The main mesh and all the `m`-face meshes of the resulting object are plotted.

```

Oh=fc_hypermesh.OrthMesh(2,10,'box',[-1,1;0,1],'type','orthotope');
% plot the main mesh
figure(1)
Oh.plotmesh('legend',true)
axis equal;xlabel('x');ylabel('y')
% plot the 1-face meshes
figure(2)
Oh.plotmesh('color',[0.8,0.8,0.8])
hold on
Oh.plotmesh('m',1,'Linewidth',2,'legend',true)
axis equal;axis off
% plot the 0-face meshes
figure(3)
Oh.plotmesh('m',1,'color','k')
hold on
Oh.plotmesh('m',0,'legend',true)
axis equal;axis off

```

Listing 13: 2D orthotope `OrthMesh` object with Matlab 2022a, main mesh (upper left), 1-face meshes (upper right), and 0-face meshes (bottom)

3.5 3d-orthotope meshed by orthotopes

In Listing 1, an `OrthMesh` object is built under Matlab for the orthotope $[-1, 1] \times [0, 1] \times [0, 2]$ with orthotope elements and `N=[10,5,10]`. The main mesh and all the `m`-face meshes of the resulting object are plotted.

3.6 Mapping of a 2d-orthotope meshed by simplices

For example, the following 2D geometrical transformation allows to deform the reference unit hypercube.

$$[0, 1] \times [0, 1] \longrightarrow \mathbb{R}^2$$

$$\begin{pmatrix} x \\ y \end{pmatrix} \longrightarrow F(x, y) = \begin{pmatrix} 20x \\ 2(2y - 1 + \cos(2\pi x)) \end{pmatrix}$$

```

Oh=fc_hypermesh.OrthMesh(2,10,'mapping',@(q) [20*q(1,:); 2*(2*q(2,:)-1+cos(2*pi*q(1,:)))]);
% plot the main mesh
figure(1)
Oh.plotmesh('legend',true)
% plot the 1-face meshes
figure(2)
Oh.plotmesh('color',[0.8,0.8,0.8])
hold on
Oh.plotmesh('m',1,'Linewidth',2,'legend',true)
% plot the 0-face meshes
figure(3)
Oh.plotmesh('m',1,'color','k')
hold on
Oh.plotmesh('m',0,'legend',true)

```

Listing 15: Mapping of a 2D simplicial `OrthMesh` object with Matlab 2022a, main mesh (upper left), 1-face meshes (upper right), and 0-face meshes (bottom)

3.7 3d-orthotope meshed by orthotopes

For example, the following 3D geometrical transformation allows to deform the reference unit hypercube.

$$[0, 1] \times [0, 1] \times [0, 1] \longrightarrow \mathbb{R}^2$$

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} \longrightarrow F(x, y, z) = \begin{pmatrix} x + \sin(4\pi y) \\ 10y \\ z + \cos(4\pi y) \end{pmatrix}$$

```

Map=@(q) [q(1,:)+ sin(4*pi*q(2,:)); 10*q(2,:); q(3,:)+cos(4*pi*q(2,:))];
Oh=fc_hypermesh.OrthMesh(3,[4,25,4], 'mapping',Map, 'type', 'orthotope');
% plot the main mesh
figure(1)
Oh.plotmesh()
legend('show')
% plot the 2-face meshes
figure(2)
Oh.plotmesh('m',2)
legend('show')
% plot the 1-face meshes
figure(3)
Oh.plotmesh('m',2,'color',[0.8,0.8,0.8], 'EdgeAlpha',0.2, 'FaceColor','none')
hold on
Oh.plotmesh('m',1,'Linewidth',2,'legend',true)
% plot the 0-face meshes
figure(4)
Oh.plotmesh('m',1,'color','k')
hold on
Oh.plotmesh('m',0,'legend',true)

```

Listing 16: Mapping of a 3D orthotope `OrthMesh` object with Matlab 2022a, main mesh (upper left), 2-face meshes (upper right), 1-face meshes (bottom left) and 0-face meshes (bottom right)

4 Benchmarking

4.1 `fc_hypermesh.bench` function

The `fc_hypermesh.bench` function can be used to obtain computationnal times of the `OrthMesh` constructor.

Syntaxe

```

fc_hypermesh.bench(d,LN)
fc_hypermesh.bench(d,LN, key,value, ...)

```

Description

```
fc_bench.bench(d,LN)
```

displays computationnal times of the `OrthMesh` constructor tessellated with simplices (default) as follows

```
ts=tic();Oh=fc_hypermesh.OrthMesh(d,LN(:,i));tcpu=toc(ts);
```

for each `i` in `1:size(LN,2)`.

- `d`, space dimension.
- `LN` is either a 1-by- n or a `d`-by- n array of positive integers.

```
fc_bench.bench(d,LN, key,value, ...)
```

Some optional `key/value` pairs arguments are available with `key`:

- `'type'` : string `'simplex'` (default) or `'orthotope'` to specify kind of tessellation.
- `'order'` : positive integer (1 by default) to specify order of the mesh elements.
- `'box'` : `d`-by-2 array of double

4.2 Examples

Listing 17: : Computationnal times of `OrthMesh` constructor in dimension `d=3` where mesh elements are 1-order simplices

```
fc_hypermesh.bench(3,25:25:175,'box',[ -1 1;-1 1;-1 1], 'type','simplex')
```

Output

```
# BENCH in dimension 3 with simplex mesh

5 Mesh refinement

5.1 Non-conforming mesh refinement

In this part we propose a preliminary refinement of a regular d -grid. We want to generate a refinement of some cells of this regular grid with d -simplices and/or d -orthotopes: the mesh obtained is therefore non-conforming.

In Figure 9, a 2D-grid with 10-by-10 cells is refined with regular subcells (i.e. same number of discretisation in each directory) made of simplices or orthotopes. For example a cell subdivided in 3-by-3 orthotopes is denoted by `orth[3 3]` and this same cell subdivided in 3-by-3 simplices (in fact $3 \times 3 \times 2$ simplices) is denoted by `simp[3 3]`. In Figure 10, a 2D-grid with 10-by-10 cells (left) and with 6-by-9 cells (right) is refined with subcells (not necessarily with same number of discretisation in each directory). In Figure 11, a 2D-grid with 10-by-10 cells (left) is refined with regular subcells made of orthotopes or simplices. On the right, a 2D-grid with 6-by-9 cells is refined with not necessarily regular subcells made of orthotopes or simplices refined with subcells respectively.

5.1.1 Refinement function

The refinement of an `OrthMesh` object whose elements are orthotopes is obtained by using the `fc_hypermesh.refinement.r` Matlabfunction.

```
scs = refine(Oh,ndiscells)
scs = refine(Oh,ndiscells,type)
scs = refine(Oh,ndiscells,types)
```

This function returns cells array of structures. Each array entry contains all cells refined with a `type` of element (simplicial or orthotope) and selected numbers of discretisation in each axis direction. Each structure (called *subcells structure*) has the fields

- d : space dimension

Figure 10: no regular refinement of a 2D-grid with orthotopes (left) and simplices (right)

Figure 11: Regular (left) and not regular (right) refinement of a 2D-grid with orthotopes and simplices

- **type**: type of element: '**'simplicial'** or '**'orthotope'**'
- **n**: 1-by- **d** array corresponding to selected numbers of discretisation in each axis direction
- **nq**: number of vertices
- **nme**: number of mesh elements
- **q**: **d**-by- **nq** vertices array
- **me**: p -by- **nme** connectivity array ($p = d + 1$ for simplices and $p = 2^d$ for orthotopes)
- **ncell**: contains all the number of the cells grid which are refined.

Description

```
scs = fc_hypermesh.refinement.refine(Oh,ndiscells)
```

The first input **Oh** is an **OrthMesh** object whose elements are orthotopes. **ndiscells** is an 1-by-**Oh.Mesh.nme** array (for regular refinement) or a **d**-by-**Oh.Mesh.nme** array. **ndiscells(:,k)** are the numbers of discretisation in each axis direction. The output is a cells array of *subcells* structure where all subcells **type** are '**'orthotope'**'

```
scs = fc_hypermesh.refinement.refine(Oh,ndiscells,type)
```

Same as previous one if **type** is '**'orthotope'**'. Otherwise **type** is '**'simplicial'**' and all subcells **type** of the output are '**'simplicial'**'

```
[scsimp,scorth] = fc_hypermesh.refinement.refine(Oh,ndiscells,types)
```

The input **types** is an 1-by-**Oh.Mesh.nme** array: if **types(k)** is equal to 0 then the k -th mesh element (cell) of the **OrthMesh** is refined with simplices otherwise with orthotopes.

```
d=2; % space dimension
N=11; % or N=[10,10]
Oh=fc_hypermesh.OrthMesh(d,N,'type','orthotope');
nme=Oh.Mesh.nme; % Number of Mesh elements
ndiscells=2*ones(1,nme);
ndiscells(1:2:nme)=3;
sc1=fc_hypermesh.refinement.refine(Oh,ndiscells,'simplex');
figure(1)
fc_hypermesh.refinement.plotsubcells(sc1)
set(legend(),'Location','eastoutside');axis image

types=zeros(1,nme);ndiscells=2*ones(1,nme);
types(1:2:nme)=1;ndiscells(1:2:nme)=3;
sc2=fc_hypermesh.refinement.refine(Oh,ndiscells,types);
figure(2)
fc_hypermesh.refinement.plotsubcells(sc2)
set(legend(),'Location','eastoutside');axis image
```

Listing 21: 2D orthotope **OrthMesh** refinement with Matlab 2022a, figure 1 (left) and figure 2 (right)

More examples are provided by scripts:

- `fc_hypermesh.refinement.demo01`
- ...
- `fc_hypermesh.refinement.demo10`

Appendices

A Memory consuming

Beware when using theses codes of memory consuming : the number of points `nq` and the number of elements quickly increase according to the space dimension `d`. When meshing a `d`-orthotope with `p`-order mesh elements by taking N intervals in each space direction, we have a number of nodes given by

$$\text{nq} = (\text{p} * N + 1)^{\text{d}}, \quad \text{for both tessellation and triangulation}$$

and the number of mesh elements is

$$\begin{aligned} \text{nme} &= N^{\text{d}}, && \text{for tessellation by orthotopes} \\ \text{nme} &= d!N^{\text{d}}, && \text{for tessellation by simplices.} \end{aligned}$$

If the array `q` is stored as `double` (8 bytes) then

$$\text{mem. size of } \text{q} = \text{d} \times \text{nq} \times 8 \text{ bytes}$$

and if the array `me` as `int` (4 bytes) then

$$\text{mem. size of } \text{me} = \begin{cases} (\text{p} + 1)^{\text{d}} \times \text{nme} \times 4 \text{ bytes} & \text{(tessellation by orthotopes)} \\ \frac{(\text{d}+\text{p})!}{\text{d}!\text{p}!} \times \text{nme} \times 4 \text{ bytes} & \text{(tessellation by simplices)} \end{cases}$$

With $N = 10$, $\text{d} \in [1, 8]$ and order $\text{p} = 1$, the values of `nq` and `nme` are given in Table 5. The memory usage for the corresponding array `q` and array `me` is available in Table 6. In Table ??, the memory usage for the array `q` and array `me` for $N = 10$, $\text{d} = 3$ and order $\text{p} \in [1, 8]$.

| <code>d</code> | <code>nq</code> = $(N + 1)^{\text{d}}$ | <code>nme</code> = N^{d} (orthotopes) | <code>nme</code> = $d!N^{\text{d}}$ (simplices) |

B Low level codes

B.1 Class object **EltMesh**

The elementary mesh class object called **EltMesh** is used to store only one mesh, the main mesh as well as any of the **m**-face meshes. This class **EltMesh** also simplifies (for me) the codes writing and its fields are the following:

- **d**, space dimension
- **m**, kind of mesh (**m** = **d** for the main mesh), tessellated with **m**-simplices or **m**-orthotopes.
- **order**, order **p** of the mesh elements
- **type**, 0 for simplicial mesh or 1 for orthotope mesh
- **nq**, number of nodes
- **q**, nodes array of dimension **d**-by-**nq**
- **nme**, number of mesh elements
- **me**, connectivity array of dimension $\frac{(\mathbf{d}+\mathbf{p})!}{\mathbf{d}!\mathbf{p}!}$ -by-**nme** for **p**-order simplices elements or $(\mathbf{p}+1)^{\mathbf{d}}$ -by-**nme** for **p**-order orthotopes elements
- **toGlobal**, index array linking local array **q** to the one of the main mesh
- **label**, name/number of this elementary mesh
- **color**, color of this elementary mesh (for plotting purpose)

B.1.1 Constructor

```
Eh = fc_hypermesh.EltMesh(m,q,me)
Eh = fc_hypermesh.EltMesh(m,q,me, key,value,...)
```

Description

```
Eh = fc_hypermesh.EltMesh(m,q,me)
```

Generates the **EltMesh** object **Eh** which contains a 1-order **m**-simplicial mesh by default. The space dimension **d** is **size(q,1)**.

- **m**, kind of mesh: tessellated with **m**-simplices.
- **q** is the nodes array of dimension **d**-by-**nq**.
- **me** is the connectivity array of dimension $(\mathbf{d}+1)$ -by-**nme** corresponding to 1-order simplices elements.

Listing 22: : `EltMesh` constructor in dimension `d=2` (simplicial mesh)

```
[q,me]=fc_hypermesh.CG.TessSim(10^3*ones(1,2));
Eh=fc_hypermesh.EltMesh(2,q,me)
```

Output

```
Eh =
EltMesh object
  type : simplex
  order : 1
  d : 2
  m : 2
  q : (2,1002001)
  me : (3,2000000)
```

`Eh = fc_hypermesh.EltMesh(m,q,me, key,value, ...)`

Some optional `key/value` pairs arguments are available with `key`:

- `'type'` : used to select the kind of elements used. The default `value` is `'simplex'` and otherwise `'orthotope'` can be used.
- `'order'` : gives the order of the mesh elements (default is 1).

Listing 23: : `EltMesh` constructor in dimension `d=3` (orthotope mesh)

```
[q,me]=fc_hypermesh.CG.TessHyp(3:5,2);
Eh=fc_hypermesh.EltMesh(3,q,me,'type','orthotope','order',2)
```

Output

```
Eh =
EltMesh object
  type : orthotope
  order : 2
  d : 3
  m : 3
  q : (3,693)
  me : (27,60)
```

B.1.2 `plotmesh` method

The `plotmesh()` member function can be used to represent the mesh given by an `EltMesh` object if the space dimension `d` is less than or equal to 3.

Syntax

```
obj.plotmesh()
obj.plotmesh(key, value, ...)
```

Description

`obj.plotmesh()`

`obj.plotmesh(key, value, ...)`

Some optional `key/value` pairs arguments are available with `key`:

- `'color'` : use to specify the color of the mesh. Otherwise `obj.color` is used.

Other `key/value` pairs arguments can be used depending of `obj.d` and `obj.m` values and they are those of the plotting function used:

- with `obj.d=3` and `obj.m=3`, `patch` function is used;
- with `obj.d=3` and `obj.m=2`, `trimesh` function is used for simplicial mesh and `patch` function is used for orthotope mesh;

- with `obj.d=3` and `obj.m=1`, `line` function is used;
- with `obj.d=3` and `obj.m=0`, `scatter3` function is used;
- with `obj.d=2` and `obj.m=2`, `triplot` function is used for simplicial mesh and `patch` function is used for orthotope mesh;
- with `obj.d=2` and `obj.m=1`, `line` function is used;
- with `obj.d=2` and `obj.m=0`, `scatter` function is used;
- with `obj.d=1` and `obj.m=1`, `line` function is used;
- with `obj.d=1` and `obj.m=0`, `scatter` function is used;

```
[q,me]=fc_hypermesh.CG.TessSim([5,4]);
Eh1=fc_hypermesh.EltMesh(2,q,me);
figure(1)
Eh1.plotmesh()
axis image
[q,me]=fc_hypermesh.CG.TessHyp([5,4],2);
Eh2=fc_hypermesh.EltMesh(2,q,me,'order',2,'type','orthotope');
figure(2)
Eh2.plotmesh()
axis image
```

B.1.3 `plotnodes` method

The `plotnodes()` member function can be used to represent nodes of the mesh given by an `EltMesh` object if the space dimension `d` is less than or equal to 3.

Syntaxe

```
obj.plotnodes()
obj.plotnodes(key, value, ...)
```

Description

`obj.plotnodes()`

Uses `scatter` function (1D and 2D) and `scatter3` function (3D) to represent nodes of the mesh as points. Vertices of the mesh elements are also nodes and they are distinguishable from others nodes.

`obj.plotnodes(key, value, ...)`

Some optional `key/value` pairs arguments are available with `key`:

- `'vcolor'` : use to specify the point color for the mesh vertices. Default is `obj.color`.

- **'vsize'** : use to specify the point size for the mesh vertices. Default is **40** .
- **'ncolor'** : use to specify the color of the nodes (not vertices) of the mesh elements. Default is **'k'** (ie. black).
- **'nsize'** : use to specify the size of the nodes (not vertices) of the mesh elements. Default is **30** .

Other **key/value** pairs arguments can be used: they are those of the **scatter** and **scatter3** function used.

B.1.4 **plotnodesNumber** method

The **plotnodesNumber()** member function can be used to display node numbers of the mesh given by an **EltMesh** object if the space dimension **d** is less than or equal to 3.

Syntax

```
obj.plotnodesNumber()
obj.plotnodesNumber(key, value, ...)
```

Description

```
obj.plotnodes()
```

Uses **fc_hypermesh.plotnodesNumber** function to represent node numbers.

```
obj.plotnodes(key, value, ...)
```

Some optional **key/value** pairs arguments are available with **key**:

- **'BackgroundColor'** : use to specify text background color. Default is **'w'** (i.e. white).
- **'margin'** : use to specify the margin. Default is **1** .
- **'HorizontalAlignment'** : Default is **'center'** .

- **'VerticalAlignment'** : Default is **'middle'** .
- **'clipping'** : Default is **'on'** .

Other **key/value** pairs arguments can be used: they are those of the **text** function used.

```
[q,me]=fc_hypermesh.CG.TessSim([5,4],3);
Eh1=fc_hypermesh.EltMesh(2,q,me,'order',3);
figure(1)
Eh1.plotmesh()
hold on
Eh1.plotnodesNumber()
axis image
axis off
[q,me]=fc_hypermesh.CG.TessHyp([5,4],2);
Eh2=fc_hypermesh.EltMesh(2,q,me,'order',2,'type','orthotope');
figure(2)
Eh2.plotmesh()
hold on
Eh2.plotnodesNumber('color','b','EdgeColor','b','FontWeight','bold')
axis image
axis off
```

Listing 26: **plotnodesNumber** method of a 2D **EltMesh** objects , **figure(1)** (left) and **figure(2)** (right)

B.1.5 **ploteltsNumber** method

The **ploteltsNumber()** member function can be used to display element numbers of the mesh given by an **EltMesh** object if the space dimension **d** is less than or equal to 3.

Syntaxe

```
obj.ploteltsNumber()
obj.ploteltsNumber(key, value, ...)
```

Description

```
obj.ploteltsNumber()
```

Uses **fc_hypermesh.plotElementsNumber** function to represent node numbers.

```
obj.ploteltsNumber(key, value, ...)
```

Some optional **key/value** pairs arguments are available with **key**:

- **'Color'** : use to specify text color. Default is **'r'** (i.e. red).
- **'BackgroundColor'** : use to specify text background color. Default is **'w'** (i.e. white).
- **'margin'** : use to specify the margin. Default is **1** .
- **'HorizontalAlignment'** : Default is **'center'** .

- **'VerticalAlignment'** : Default is **'middle'** .
- **'clipping'** : Default is **'on'** .
- **'vLineColor'** : Draw lines between vertices and barycenter of the mesh elements. Default is **''** (no lines).
- **'vLineStyle'** : Select lines type. Default is **:** (dotted lines).
- **'vLineWidth'** : Set lines width. Default is **0.5** .

Other **key/value** pairs arguments can be used: they are those of the **text** function used.

```
[q,me]=fc_hypermesh.CG.TessSim([5,4],3);
Eh1=fc_hypermesh.EltMesh(2,q,me,'order',3);
figure(1)
Eh1.plotmesh()
hold on
Eh1.ploteltsNumber()
axis image
axis off
[q,me]=fc_hypermesh.CG.TessHyp([5,4],2);
Eh2=fc_hypermesh.EltMesh(2,q,me,'order',2,'type','orthotope');
figure(2)
Eh2.plotmesh()
hold on
Eh2.ploteltsNumber('color','b','EdgeColor','salmon','FontWeight','bold',...
    'vLineColor','salmon','BackgroundColor','LightGrey')
axis image
axis off
```
