

Documentation of the FC-OOGMSH Matlab toolbox version 0.0.15*

François Cuvelier[†]

October 6, 2017

Abstract

This Matlab toolbox make it possible to generate mesh files from `.geo` file by using `gmsh`. It's also possible with the `ooGMSH` class to read the mesh file and to store its contains in more user-friendly form. This toolbox must be regarded as a very simple interface between gmsh files and Octave. So you are free to create any data structures or objects you want from an ooGmsh object.

1 Introduction

The FC-OOGMSH Matlab toolbox is closely related to `gmsh`, see [2] or [1], which is a three-dimensional finite element mesh generator with built-in pre- and post-processing facilities. `gmsh` can also build two-dimensional meshes and three-dimensional surface meshes. This toolbox was initially created to make it possible from Matlab to rapidly

- generate mesh file from `.geo` file by using `gmsh`
- efficiently read this mesh file and store its contents in `ooGMSH` Matlab object easy to manipulate.

The `ooGMSH` Matlab object can be used to create, from a `.msh` file, any data structures or objects needed by your project. For example, the fc-simesh Matlab toolbox uses this toolbox to create the `SiMESH` object containing all the simplices elements of the mesh.

In a first step we quickly present the installation of `gmsh` on Linux (for Windows and Mac OS X precompiled software are also provided on <http://gmsh.info>). Then, we explain how to configure the FC-OOGMSH toolbox for using `gmsh`. Finally, we describe the FC-OOGMSH's functions which use `gmsh` to create mesh files.

remark 1.1

Under Windows the 32bit version of `gmsh` is needed : the system function of Matlab seems not to support running 64bit applications.

2 gmsh installation (Linux 64bit)

Binaries for Linux 64 bits are available on <http://gmsh.info>).

- To obtain the current stable release (version 2.15.0, December 4 2016) directly from a terminal one can run

```
Terminal
wget http://gmsh.info/bin/Linux/gmsh-2.15.0-
Linux64.tgz
```

- To obtain the development version (automated nightly snapshots) directly from a terminal one can run

```
Terminal
wget http://gmsh.info/bin/Linux/gmsh-svn-Linux64.tgz
```

To install the version 2.15.0 on directory `~/software/GMSH`, one can do the commands

```
Terminal
mkdir -p ~/software/GMSH
cd ~/software/GMSH
wget http://gmsh.info/bin/Linux/gmsh-2.15.0-Linux64.tgz
tar zxvf gmsh-2.15.0-Linux64.tgz
```

To run `gmsh` we can used the following command in a terminal

```
Terminal
~/software/GMSH/gmsh-2.15.0-Linux/bin/gmsh &
```

3 Installation of the fc-oogmsh toolbox

For all the OS (Linux, Mac OS, Window), the various stages for the installation are identical

- **step 1:** download the file `mfc_oogmsh_install.m`
- **step 2:** run this file under Matlab.
- **step 3:** (optional) set the path of the `gmsh` binary.

3.1 Linux installation

One have to download the install file `mfc_oogmsh_install.m` and save it in the directory where the toolbox will be installed.

When the installation script is executed, it downloads, extracts and configures the *fc-oogmsh* and the required *fc-tools* toolbox in the current directory. By default, the `gmsh` binary is supposed to be located in `/usr/bin/gmsh`. To specify an other location one can do

```
mfc_oogmsh_install('gmsh_bin', '<PATH>/gmsh')
```

where `<PATH>` is the path of the `gmsh` binary.

One also can change the location of the `gmsh` binary after the installation by using

```
fc_oogmsh.configure('gmsh_bin', '<PATH>/gmsh')
```

or directly by modifying the `configure_loc.m` generated during the install process.

For example, to install this toolbox in directory `~/Matlab/toolboxes`, in a terminal one can do:

- **step 1:**

```
Terminal
mkdir -p ~/Matlab/toolboxes
cd ~/Matlab/toolboxes
wget http://www.math.univ-paris13.fr/~cuvelier/
    software/codes/fc-oogmsh/dev/
    mfc_oogmsh_install.m
```

- **step 2:** Then in a Matlab terminal run the following commands

```
Command Window
>> cd ~/Matlab/toolboxes
fx >> mfc_oogmsh_install
```

There is the output of the `mfc_oogmsh_install` command:

```
1- Downloading and extracting the toolboxes
-> <fc-tools>[dev] ... OK
-> <fc-oogmsh>[dev] ... OK
2- Setting the <fc-oogmsh> toolbox
Write in ~/Matlab/toolboxes/fc-oogmsh-full/mfc-oogmsh-dev/configure_loc.m ...
-> done
3- Using the <fc-oogmsh> toolbox
Under Matlab:
    addpath('~/Matlab/toolboxes/fc-oogmsh-full/mfc-oogmsh-dev')
    fc_oogmsh.init()

See ~/Matlab/toolboxes/mfc_oogmsh_set.m
```

The complete toolbox (i.e. with the `FC-TOOLS` toolbox included) is stored in the directory `~/Matlab/toolboxes/fc-oogmsh-full` and, for each Matlab session, one have to set the toolbox by running `mfc_oogmsh_set` script or

```
Command Window
>> addpath('~/Matlab/toolboxes/fc-oogmsh-full/mfc-
    oogmsh-dev')
fx >> fc_oogmsh.init()
```

For **uninstalling**, one just have to delete directory `~/Matlab/toolboxes/fc-oogmsh-full`

3.2 Mac OS installation

One have to download the install file `mfc_oogmsh_install.m` and save it in the directory where the toolbox will be installed.

When the installation script is executed, it downloads, extracts and configures the `fc-oogmsh` and the required `fc-tools` toolbox in the current directory. By default, the gmsh binary is supposed to be located in `~/Softwares/GMSh/Gmsh.app/Contents/MacOS/gmsh`. To specify an other location one can do

```
mfc_oogmsh_install('gmsh_bin', '<PATH>/gmsh')
```

where `<PATH>` is the path of the gmsh binary.

One also can change the location of the gmsh binary after the installation by using

```
fc_oogmsh.configure('gmsh_bin', '<PATH>/gmsh')
```

or directly by modifying the `configure_loc.m` generated during the install process.

For example, to install this toolbox in directory `~/Matlab/toolboxes`, in a terminal one can do:

- **step 1:**

```
Terminal
mkdir -p ~/Matlab/toolboxes
cd ~/Matlab/toolboxes
curl http://www.math.univ-paris13.fr/~cuvelier/
    software/codes/fc-oogmsh/dev/
mfc_oogmsh_install.m > mfc_oogmsh_install.m
```

- **step 2:** Then in a Matlab terminal run the following commands

```
Command Window
>> cd ~/Matlab/toolboxes
fx >> mfc_oogmsh_install
```

There is the output of the `mfc_oogmsh_install` command:

```
1- Downloading and extracting the toolboxes
-> <fc-tools>[dev] ... OK
-> <fc-oogmsh>[dev] ... OK
2- Setting the <fc-oogmsh> toolbox
Write in ~/Matlab/toolboxes/fc-oogmsh-full/mfc-oogmsh-dev/configure_loc.m ...
-> done
3- Using the <fc-oogmsh> toolbox
Under Matlab:
    addpath('~/Matlab/toolboxes/fc-oogmsh-full/mfc-oogmsh-dev')
    fc_oogmsh.init()
```

See `~/Matlab/toolboxes/mfc_oogmsh_set.m`

The complete toolbox (i.e. with the **FC-TOOLS** toolbox included) is stored in the directory `~/Matlab/toolboxes/fc-oogmsh-full` and, for each Matlab session, one have to set the toolbox by running `mfc_oogmsh_set` script or

```
Command Window
>> addpath('~/Matlab/toolboxes/fc-oogmsh-full/mfc-
oogmsh-dev')
fx >> fc_oogmsh.init()
```

For **uninstalling**, one just have to delete directory `~/Matlab/toolboxes/fc-oogmsh-full`

3.3 Windows installation

To use this toolbox under Matlab 64bit, one needs to install gmsh 32bit!

One have to download the install file `mfc_oogmsh_install.m` and save it in the directory where the toolbox will be installed.

When the installation script is executed, it downloads, extracts and configures the *fc-oogmsh* and the required *fc-tools* toolbox in the current directory. By default, the gmsh binary is supposed to be located in `<USERDIR>\Softwares\GMSH\gmsh.exe`. where `<USERDIR>` is the user directory. To specify an other location one can do

```
mfc_oogmsh_install('gmsh_bin', '<PATH>\gmsh')
```

where `<PATH>` is the path of the gmsh binary.

One also can change the location of the gmsh binary after the installation by using

```
fc_oogmsh.configure('gmsh_bin', '<PATH>\gmsh')
```

or directly by modifying the `configure_loc.m` generated during the install process.

For example, if the installation file is saved in directory `<USERDIR>/Matlab/toolboxes` then in a Matlab terminal one run the following commands

```
Command Window
>> cd ~/Matlab/toolboxes
fx >> mfc_oogmsh_install
```

There is the output of the `mfc_oogmsh_install` command:

- 1- Downloading and extracting the toolboxes
 -> <fc-tools>[dev] ... OK
 -> <fc-oogmsh>[dev] ... OK
- 2- Setting the <fc-oogmsh> toolbox
 Write in `<USERDIR>/Matlab/toolboxes/fc-oogmsh-full/mfc-oogmsh-dev/configure_loc.m` ...
 -> done
- 3- Using the <fc-oogmsh> toolbox
 Under Matlab:
`addpath('<USERDIR>/Matlab/toolboxes/fc-oogmsh-full/mfc-oogmsh-dev')`

```
fc_oogmsh.init()
```

See <USERDIR>/Matlab/toolboxes/mfc_oogmsh_set.m

The complete toolbox (i.e. with the **FC-TOOLS** toolbox included) is stored in the directory <USERDIR>/Matlab/toolboxes/fc-oogmsh-full and, for each Matlab session, one have to set the toolbox by running **mfc_oogmsh_set** script or

Command Window

```
>> addpath ('<USERDIR>/Matlab/toolboxes/fc-oogmsh-full/
    mfc-oogmsh-dev')
fx >> fc_oogmsh.init()
```

For **uninstalling**, one just have to delete directory <USERDIR>/Matlab/toolboxes/fc-oogmsh-full

4 gmsh interface

All the functions provided in this section use **gmsh** to create a mesh file from a **gmsh** geometry script file (extension *.geo*).

4.1 function gmsh.buildmesh2d

This function uses **gmsh** and a *.geo* file (describing a 2D-geometry) to generate a 2D-mesh.

Syntaxe

```
meshfile=gmsh.buildmesh2d(geofile,N)
meshfile=gmsh.buildmesh2d(geofile,N,Name,Value)
```

Description

`meshfile=gmsh.buildmesh2d(geofile,N)` create a 2D-mesh using **gmsh** and the *geo* file *geofile* (without path). The integer *N* has two functions : numbering the name of the generated mesh as <*geofile* without extension and path> + <-*N.msh*> and passing this number to **gmsh** via the option "-setnumber *N* <*N*>". Usually we used this parameter in **gmsh** to set the prescribed mesh element size at the points. (see given *geo* files)
As output return a file name (with full path) corresponding to the mesh generated by **gmsh**.

`meshfile=gmsh.buildmesh2d(geofile,N,Name,Value, ...)` specifies function options using one or more *Name,Value* pair arguments. The *Name* options can be

- '**geodir**' : to specify the directory of the *geo* file *geofile*,

- '**meshdir**' : to specify the directory where the mesh file will be written,
- '**meshfile**' : to specify the name of the mesh file (with path and .msh extension),
- '**check**' : to perform various consistency checks on mesh with **gmsh**, if Value is true. (default : false)
- '**force**' : to force meshing even if the mesh file already exists if Value is true (default : false)
- '**verbose**' : to specify the degree of verbosity (0, silence; 2, default; ...)
- '**strings**' : cells array of strings corresponding to **gmsh** options given with -string "... " (default empty) (see **gmsh** documentation)

Examples All the following examples use the .geo file **condenser11.geo** which is in the directory **geodir** of the toolbox.

Matlab commands with output

```

disp( ****_gmsh.buildmesh2d:_1st_call')
meshfile=gmsh.buildmesh2d('condenser11',25,'force',true);
disp( ****_gmsh.buildmesh2d:_2nd_call')
meshfile=gmsh.buildmesh2d('condenser11',25);

**** gmsh.buildmesh2d : 1st call
[fc-oogmsh] Input file : <fc-oogmsh>/geodir/condenser11.geo
[fc-oogmsh] Starting building mesh <fc-oogmsh>/meshes/condenser11-25.msh with gmsh 2.15.0

```

4.2 function gmsh.buildmesh3d

This function uses gmsh and a *.geo* file (describing a 3D-geometry) to generate a 3D-mesh. See function **gmsh.buildmesh2d** for usage and options.

4.3 function gmsh.buildmesh3ds

This function uses `gmsh` and a `.geo` file (describing a 3D surface geometry or a 3D-geometry) to generate a 3D surface mesh. See function `gmsh.buildmesh2d` for usage and options.

4.4 function gmsh.buildpartmesh2d

This function uses `gmsh` and a `.msh` file (containing of a 2D-mesh) to generate a 2D partitioned mesh.

Syntax

```
partmeshfile=gmsh.buildpartmesh2d(meshfile,np)  
partmeshfile=gmsh.buildpartmesh2d(meshfile,np,Name,Value)
```

Description

`partmeshfile=gmsh.buildpartmesh2d(meshfile,np)` create a 2D partitioned mesh using `gmsh` and the `msh` file `meshfile` (with path). The integer `np` is the number of partitions.

As output return a file name (with full path) corresponding to the partitioned mesh generated by `gmsh`. The output file name is construct as following : <meshfile without extension>-part<np>.msh

`partmeshfile=gmsh.buildpartmesh2d(meshfile,np,Name,Value, ...)` specifies function options using one or more `Name,Value` pair arguments. The `Name` options can be

- '`savedir`' : to specify the directory where the partitioned mesh file will be written,
- '`check`' : to perform various consistency checks on mesh with `gmsh`, if Value is true. (default : false)
- '`force`' : to force meshing even if the mesh file already exists if Value is true (default : false)
- '`verbose`' : to specify the degree of verbosity (0, silence; 2, default; ...)
- '`strings`' : cells array of strings corresponding to `gmsh` options given with `-string "..."` (default empty) (see `gmsh` documentation)

Examples All the following examples use the `meshfile` as output of the command :

```
meshfile=gmsh.buildmesh2d('condenser11',25);
```

Matlab commands with output

```
meshfile=gmsh.buildmesh2d('condenser11',25,'verbose',0);  
pmfile=gmsh.buildpartmesh2d(meshfile,5,'force',true);
```

```
[fc-oogmsh] Input file : <fc-oogmsh>/meshes/condenser11-25.msh  
[fc-oogmsh] Starting building mesh <fc-oogmsh>/meshes/condenser11-25-part5.msh with gmsh 2.15.0

4.5 function gmsh.buildpartmesh3d

This function uses gmsh and a *.msh* file (containing of a 3D-mesh) to generate a 3D partitioned mesh.

4.6 function gmsh.buildpartmesh3ds

This function uses gmsh and a *.msh* file (containing of a 3D surface mesh) to generate a 3D partitioned surface mesh.

4.7 function gmsh.buildPartRectangle

This function uses gmsh and the *geodir/rectanglepart.geo* file to generate a 2D regular partitioned mesh of the rectangle $[0, L_x] \times [0, L_y]$ with $N_x \times N_y$ partitions.

Syntaxe

```
meshfile=gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N)  
  
meshfile=gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N, ...  
Name,Value)
```

Description

`meshfile=gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N)` create a 2D regular partitioned mesh using `gmsh` of the rectangle $[0, Lx] \times [0, Ly]$ with $Nx \times Ny$ partitions. The `N` parameter is passed to `gmsh` to set the prescribed mesh element size at the points

As output return a file name (with full path) corresponding to the partitioned mesh generated by `gmsh`. The default output file name is construct as following : `rectanglepart-Lx%.3f-Ly%.3f-Nx%d-Ny%d-N%d.msh`

`meshfile=gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N,Name,Value, ...)` specifies function options using one or more `Name,Value` pair arguments. The `Name` options can be

- '`meshdir`' : to specify the directory where the partitioned mesh file will be written,
- '`meshfile`' : to specify the mesh file name with `.msh` extension. Without path, the file is written in `<meshdir>` directory.
- '`check`' : to perform various consistency checks on mesh with `gmsh`, if `Value` is true. (default : false)
- '`force`' : to force meshing even if the mesh file already exists if `Value` is true (default : false)
- '`verbose`' : to specify the degree of verbosity (0, silence; 2, default; ...)
- '`strings`' : cells array of strings corresponding to `gmsh` options given with `-string "..."` (default empty) (see `gmsh` documentation)

Examples All the following examples ...

Matlab commands with output

```
pmfile=gmsh.buildpartrectangle(1,1,3,2,100,'force',true);
```

```
[fc-oogmsh] Input file : <fc-oogmsh>/geodir/rectanglepart.geo  
[fc-oogmsh] Starting building mesh <fc-oogmsh>/meshes/rectanglepart-Lx1.000-Ly1.000-Nx3-Ny2-N100.msh with gmsh 2.15.0

5 ooGmsh class

The **ooGmsh** class can be used to read **gmsh** mesh files with the MSH ASCII file format described for example in [1], section 9.1.

In a .msh file the kind of mesh elements are identified by their *elm-type* integer values :

<i>elm-type</i>	description
1	2-node line
2	3-node triangle
3	4-node quadrangle
4	4-node tetrahedron
5	8-node hexahedron
6	6-node prism
7	5-node pyramid
8	3-node second order line (2 nodes associated with the vertices and 1 with the edge)

- 9 6-node second order triangle (3 nodes associated with the vertices and 3 with the edges)
 10 9-node second order quadrangle (4 nodes associated with the vertices, 4 with the edges and 1 with the face)
 11 10-node second order tetrahedron (4 nodes associated with the vertices and 6 with the edges)
 12 27-node second order hexahedron (8 nodes associated with the vertices, 12 with the edges, 6 with the faces and 1 with the volume)
 13 18-node second order prism (6 nodes associated with the vertices, 9 with the edges and 3 with the quadrangular faces)
 14 14-node second order pyramid (5 nodes associated with the vertices, 8 with the edges and 1 with the quadrangular face)
 15 1-node point
 16 8-node second order quadrangle (4 nodes associated with the vertices and 4 with the edges)
 17 20-node second order hexahedron (8 nodes associated with the vertices and 12 with the edges)
 18 15-node second order prism (6 nodes associated with the vertices and 9 with the edges)
 19 13-node second order pyramid (5 nodes associated with the vertices and 8 with the edges)
 20 9-node third order incomplete triangle (3 nodes associated with the vertices, 6 with the edges)
 21 10-node third order triangle (3 nodes associated with the vertices, 6 with the edges, 1 with the face)
 22 12-node fourth order incomplete triangle (3 nodes associated with the vertices, 9 with the edges)
 23 15-node fourth order triangle (3 nodes associated with the vertices, 9 with the edges, 3 with the face)
 24 15-node fifth order incomplete triangle (3 nodes associated with the vertices, 12 with the edges)
 25 21-node fifth order complete triangle (3 nodes associated with the vertices, 12 with the edges, 6 with the face)
 26 4-node third order edge (2 nodes associated with the vertices, 2 internal to the edge)
 27 5-node fourth order edge (2 nodes associated with the vertices, 3 internal to the edge)
 28 6-node fifth order edge (2 nodes associated with the vertices, 4 internal to the edge)
 29 20-node third order tetrahedron (4 nodes associated with the vertices, 12 with the edges, 4 with the faces)
 30 35-node fourth order tetrahedron (4 nodes associated with the vertices, 18 with the edges, 12 with the faces, 1 in the volume)
 31 56-node fifth order tetrahedron (4 nodes associated with the vertices, 24 with the edges, 24 with the faces, 4 in the volume)

92	64-node third order hexahedron (8 nodes associated with the vertices, 24 with the edges, 24 with the faces, 8 in the volume)
93	125-node fourth order hexahedron (8 nodes associated with the vertices, 36 with the edges, 54 with the faces, 27 in the volume)

When reading a .msh file generated by `gmsh`, we split the mesh elements by *elm-type* and generate an array of `ELMT` structure. The dimension of this array is the number of differents *elm-type* founds on the .msh file. The `Elmt` structure is given by

Fields of Elmt structure

type	:	integer refers to the type of the element : 1 for 2-node line, 2 for 3-node triangle, ... See the <i>elm-type</i> description of [1], section 9.1.
geo	:	string contains the kind of geometry: 'line', 'triangle', 'tetrahedron', ...
d	:	integer space dimension or <i>d</i> -simplex.
order	:	integer order of the element
n_me	:	integer number of mesh elements
me	:	array of <i>d</i> + 1-by-n_me integers connectivity array
phys_lab	:	array of n_me-by-... integers physical labels of the elements
geo_lab	:	array of n_me-by-... integers geometrical labels of the elements
nb_parts	:	array of n_me-by-1 integers number of mesh partitions to which the element belongs
part_lab	:	array of n_me-by-max(nb_parts) integers part_lab(<i>i</i> , 1 : nb_parts(<i>i</i>)) contains all the partitions index to which the <i>i</i> -th element belongs.

The `ooGMSH` class was created to store a maximum of(all the) information(s) contained in the .msh file. The properties of this class are:

Properties of `ooGmsh` class

dim	:	integer space dimension
n _q	:	integer number of vertices/nodes
q	:	dim-by-n _q array of reals array of vertex coordinates
types	:	array of integers List of the element types found in the mesh file.
orders	:	array of integers List of the orders of the element types found in the mesh file.
sElts	:	array of Elmt structure One Elmt structure by element type, such that sElts(<i>i</i>) contains all the elements of type types(<i>i</i>) and order orders(<i>i</i>).

The `ooGmsh` class have only one constructor :

```
Gh=ooGmsh(meshfile)
```

where meshfile is the name of ... a mesh file

5.1 Sample 1

The 2d .geo file `condenser.geo` is used to create a .msh file : `condenser-25.msh`. This .msh file contains only 1 (2-node line) and 2 (3-node triangle) *elm-type*.

Matlab commands with output

```
meshfile=gmsh.buildmesh('condenser',25,'verbose',0);
Gh = ooGmsh(meshfile)

Gh =
ooGmsh with properties:
    q: (2x55670 double)
    dim: 2 double
    nq: 55670 double
    sElts: (3x1 struct)
    toGlobal: (1x55670 double)
    partitionedfile: 0 logical
    orders: 1 double
    types: [ 1 2 15 ] (1x3 int32)
```

5.2 Sample 2

The 3d .geo file `cylinderkey.geo` is used to create a .msh file : `cylinderkey-10.msh`. This .msh file contains 1 (2-node line), 2 (3-node triangle) and 4 (4-node tetrahedron) *elm-type*.

Matlab commands with output

```
meshfile=gmsh.buildmesh3d('cylinderkey',10,'verbose',0,'force',true);
Gh = ooGmsh(meshfile)

Gh =

ooGmsh with properties:
    q: (3x5129 double)
    dim: 3 double
    nq: 5129 double
    sElts: (3x1 struct)
    toGlobal: (1x5129 double)
    partitionnedfile: 0 logical
    orders: 1 double
    types: [ 1 2 4 ] (1x3 int32)
```

5.3 Sample 3

The 3d .geo file *ball8.geo* is used to create a 3d surface .msh file : **ball8-50.msh**. This .msh file contains 1 (2-node line), 2 (3-node triangle) and 15 (1-node point) *elm-type*.

Matlab commands with output

```
meshfile=gmsh.buildmesh3ds('ball8',50,'verbose',0,'force',true);
Gh = ooGmsh(meshfile)

Gh =

ooGmsh with properties:
    q: (3x37404 double)
    dim: 3 double
    nq: 37404 double
    sElts: (3x1 struct)
    toGlobal: (1x37404 double)
    partitionnedfile: 0 logical
    orders: 1 double
    types: [ 1 2 15 ] (1x3 int32)
```
