

fc simesh Matlab toolbox, User's Guide*

version 0.4.2

Abstract

This object-oriented Matlab toolbox allows to use simplicial meshes generated from `gmsh` (in dimension 2 or 3) or an hypercube triangulation (in any dimension). For graphical representation the `fc-siplt` toolbox is used.

1 Introduction

The **fc_simesh** Matlab toolbox was created to simplify the use of simplicial meshes and to easily represent data on all or parts of them. In 2D or 3D **gmsh** can be used under Matlab to build triangular or tetrahedral meshes by using the **fc_oogmsh** toolbox[1]. Thereafter the mesh stored as a file (.msh) can be read by using the `fc_simesh.siMesh` object. In Listing 1, a 2D example is provided with the 4 generated figures. For graphic representations, the **fc_siplt** toolbox[2] is used by the `fc_simesh.siMesh` object `Th` as follows `Th.plotmesh(...)` is `fc_siplt.plotmesh(Th,...)`, `Th.plot(...)` is `fc_siplt.plot(Th,...)` and so on.

In higher dimension the `Cthypermesh` toolbox[3] can be used to obtain meshes of an hypercube by using the `fc_simesh.hypercube` function.

2 Installation

This toolbox was tested on various OS with Matlab releases:

Operating system	2017a	2017b	2018a	2018b	2019a
CentOS 7.7.1908	✓	✓	✓	✓	✓

MacOS Mojave 10.14.4	✓	✓	✓	✓	✓
MacOS Catalina 10.15.2	✓	✓	✓	✓	✓
Windows 10 (1909)	✓	✓	✓	✓	✓

It is not compatible with Matlab releases prior to R2015b.

One just has to get/download the install file

```
mfc_simesh_install.m
```

or get it on the dedicated web page. Thereafter, one run it under Matlab. This command download, extract and configure the  toolbox and all the required toolboxes in the current directory.

For example, to install this toolbox in `~/Matlab` directory, one has to copy the file `mfc_simesh_install.m` in the `~/Matlab` directory. Then in a Matlab terminal run the following commands

```
>> cd ~/Matlab  
>> mfc_simesh_install
```

There is the output of the `mfc_simesh_install` command on a Linux computer:

The complete toolbox (i.e. with all the other needed toolboxes) is stored in the directory `~/Matlab/fc-simesh-full` and, for each Matlab session, one have to set the toolbox by:

3 Mesh Objects

In geometry, a simplex is a generalization of the notion of a triangle or tetrahedron to arbitrary dimensions. Specifically, a k -simplex in \mathbb{R}^{\dim} , $0 \leq k \leq \dim$, is a polytope which is the convex hull of its $k+1$ vertices of \mathbb{R}^{\dim} . More formally, suppose the $k+1$ vertices $q^0, \dots, q^k \in \mathbb{R}^{\dim}$ such that $q^1 - q^0, \dots, q^k - q^0$ are linearly independent. Then, the k -simplex K determined by them is the set of points

$$K = \left\{ \sum_{i=0}^k \lambda_i q^i \mid \lambda_i \geq 0, i \in \llbracket 0, k \rrbracket, \text{ with } \sum_{i=0}^k \lambda_i = 1 \right\}.$$

We denote by **k -simplicial elementary mesh** in \mathbb{R}^{dim} , $0 \leq k \leq \text{dim}$, a mesh with **unique label** only composed with k -simplices.

A **d -simplicial mesh** in \mathbb{R}^{dim} , $0 \leq d \leq \text{dim}$, is an union of k -simplicial elementary meshes with $k \in [0, d]$.

3.1 fc_simesh.siMeshElt object

An elementary d -simplicial mesh in dimension dim is represented by the class **fc_simesh.siMeshElt**. We give properties of this class :

Properties of `fc_simesh.siMeshElt` object for d -simplicial elementary meshes in \mathbb{R}^{dim}

<code>dim</code>	: integer space dimension
<code>d</code>	: integer ($0 \leq d \leq \text{dim}$)
<code>nq</code>	: integer number of vertices
<code>nme</code>	: integer number of elements (d -simplices)
<code>q</code>	: dim -by- <code>nq</code> array of reals array of vertex coordinates
<code>me</code>	: $(d + 1)$ -by- <code>nme</code> array of integers connectivity array for mesh elements
<code>vols</code>	: 1-by- <code>nme</code> array of reals array of mesh element volumes
<code>h</code>	: double mesh step size (=maximum edge length in the mesh)
<code>toGlobal</code>	: 1-by- <code>nq</code> array of integers convert from local to global mesh vertices numbering. Prefer the use of <code>toParents{end}</code> instead. <i>It will be removed in a future release.</i>
<code>toParent</code>	: 1-by- <code>nq</code> array of integers convert from local to parent mesh vertices numbering (same as <code>toGlobal</code> if not part of a partitioned mesh). Prefer the use of <code>toParents{1}</code> instead. <i>It will be removed in a future release.</i>
<code>nqParents</code>	: 1-by- n array of integers <code>nqParents(1)</code> number of vertices in the <i>parent</i> mesh, <code>nqParents(2)</code> number of vertices in the <i>parent</i> of the <i>parent</i> mesh, <code>nqParents(end)</code> number of vertices in the <i>global</i> mesh.
<code>toParents</code>	: 1-by- n cell array <code>toParents{1}</code> indices array which convert local vertices numbering to the <i>parent</i> mesh vertices numbering, <code>toParents{2}</code> indices array which convert local vertices numbering to the <i>parent</i> of the <i>parent</i> mesh, <code>toParents{end}</code> indices array which convert local vertices numbering to the <i>global</i> mesh.

More precisely

- $q(i,j)$ is the i -th coordinate of the j -th vertex, $i \in \{1, \dots, \text{dim}\}$, $j \in \{1, \dots, nq\}$. The j -th vertex will be also denoted by $q^j = q(:, j)$.
- $me(r,k)$ is the storage index of the r -th vertex of the k -th element (d -simplex), in the array `q`, for $r \in \{1, \dots, d + 1\}$ and $k \in \{1, \dots, nme\}$. So $q(:, me(r,k))$ represents the coordinates of the r -th vertex of the k -th mesh element.
- $vols(k)$ is the volume of the k -th d -simplex .

3.2 fc_simesh.siMesh object

A d -simplicial mesh in dimension dim , represented as an **fc_simesh.siMesh** object, is an union of **fc_simesh.siMeshElt** objects which are elementary l -simplicial meshes ($0 \leq l \leq d$) in space dimension dim .

fc_simesh.siMesh object properties	
dim	: integer space dimension
d	: integer d -dimensional simplicial mesh
sTh	: array of fc_simesh.siMeshElt objects
nsTh	: number of fc_simesh.siMeshElt objects
sThsimp	: array of nsTh integers i -th fc_simesh.siMeshElt object in sTh is a sThsimp (i)-simplicial elementary mesh
sThlab	: array of nsTh integers in sTh label of i -th fc_simesh.siMeshElt object in sTh is number sThlab (i)
nq	: integer number of vertices in the mesh
toGlobal	: 1-by- nq array of integers convert from local to global mesh vertices numbering. Prefer the use of ndtoParent instead. <i>It will be removed in a future release.</i>
toParent	: 1-by- nq array of integers convert from local to parent mesh vertices numbering (same as toGlobal if not part of a partitioned mesh). Prefer the use of toParents1 instead. <i>It will be removed in a future release.</i>
nqParents	: 1-by- n array of integers Only used with partitioned mesh and the FC-PSIMESH toolbox.
toParents	: 1-by- n cell array Only used with partitioned mesh and the FC-PSIMESH toolbox.

Let **Th** be a **fc_simesh.siMesh** object. The global dim -by- $(\text{Th}.\text{nq})$ array **q** of mesh vertices is not explicitly stored in **Th**, however one can easily build it if necessary:

```
q=zeros(Th.dim,Th.nq);
for i=Th.find(Th.d)
    q(:,Th.sTh{i}.toParents{1})=Th.sTh{i}.q;
end
```

From the output of the Listing 2 or from the Figure 1 the complete domain is

$$\Omega = \Omega_1 \cup \Omega_2 \cup \Omega_{10} \cup \Omega_{20}$$

and we note

$$\Gamma = \Gamma_1 \cup \Gamma_2 \cup \Gamma_{20} \cup \Gamma_{101} \cup \Gamma_{102} \cup \Gamma_{103} \cup \Gamma_{104}.$$

So this mesh is 2-simplicial mesh in \mathbb{R}^2 and is composed of :

- four 2-simplicial elementary meshes : Ω_i , $\forall i \in \{1, 2, 10, 20\}$

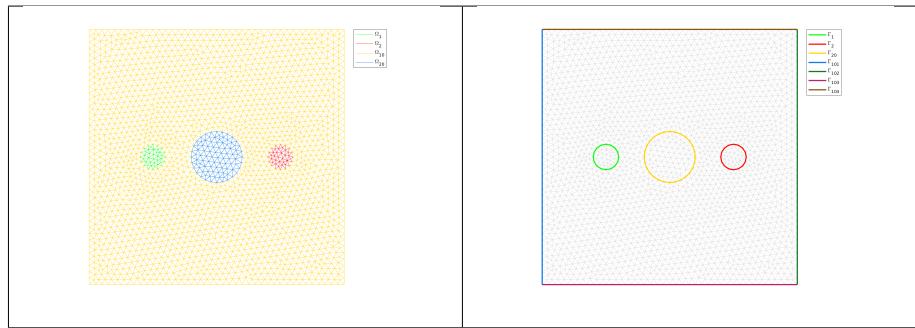

Figure 1: 2D **fc_simesh.siMesh** object from **sample20.geo**

The mesh obtained from the Listing 4 or from the Figure 3 is a 2-simplicial mesh in \mathbb{R}^3 and is composed of :

- four 2-simplicial elementary meshes : Ω_i , $\forall i \in \llbracket 1, 4 \rrbracket$
- eight 1-simplicial elementary meshes : Γ_i $\forall i \in \llbracket 1, 8 \rrbracket$

3.4 Methods of the `fc_simesh.siMesh` object

3.4.1 `fc_simesh.siMesh` constructor

The constructor of the `fc_simesh.siMesh` class can initialize the object from various kind of mesh file format : `.msh` (default `gmsh` format), `.mesh` (`FreeFEM++` or `Medit`) or ... (`triangle`).

Syntaxe

```
Th=fc_simesh.siMesh( meshfile )
Th=fc_simesh.siMesh( meshfile ,Name, Value )
```

Description

`Th=fc_simesh.siMesh(meshfile)` create the `fc_simesh.siMesh` object \mathcal{T}_h from the mesh file `meshfile` (`gmsh` format by default).

`Th=fc_simesh.siMesh(meshfile,Key,Value, ...)` specifies function options using one or more `Key,Value` pair arguments. The string `Key` options can be

- `'format'` : to specify the format of the mesh file `meshfile`. `Value` must be '`medit`', '`gmsh`' (default), '`freefem`' or '`triangle`'.
- `'dim'` : to specify the space dimension (default 2),
- `'d'` : to specify the dimensions of the simplices to read, (default `[dim,dim-1]`)

Examples The following example use the function `fc_oogmsh.gmsh.buildmesh2d` of the `FC-OOGMSH` toolbox to build the mesh from the `.geo` file `condenser11.geo`. This `.geo` file is located in the directory `geodir/2d` of the `FC-OOGMSH` toolbox.

Listing 5: `fc_simesh.siMesh` constructor

```
meshfile=fc_oogmsh.gmsh.buildmesh2d('condenser11',25,'verbose',0);
disp('***_Read_mesh_*_*');
Th=fc_simesh.siMesh(meshfile)
```

Output

```

3.4.2 `find` method

We denote by `Th` a `fc_simesh.siMesh` object.

- `Th.find(d)` : returns the sorted indices array of the `d`-simplicial elementary meshes in the array `Th.sTh`.
- `Th.find(d,labels)` : returns the sorted indices of the `d`-simplicial elementary meshes with label in `labels`. `labels` could be an index, an array of indices. If nothing is found then return `[]`.

Several examples are given in functions:

`fc_simesh.demos.find2D()`, `fc_simesh.demos.find3D()`, `fc_simesh.demos.find3Ds()`

Now some very basic samples are presented.

```

3.4.3 feval method

Evaluates a vectorized function at vertices of the mesh. We denote by **Th** a **fc_simesh.siMesh** object.

- **res=Th.feval(fun)** : the input parameter **fun** is either a function or a cell array of function handles for vector-valued functions. If **fun** is a function then the output is an **Th.nq**-by-1 array. If **fun** is a cell array of function handles then the output is an **Th.nq**-by-length(**fun**) array.
- **res=Th.feval(fun,key,value,...)** specifies function options using one or more **key,value** pair arguments. The string **key** options could be
 - **d** : to specify the **d**-simplicial elementary meshes on which to evaluate the function (default **Th.d**). A zero value is set on all vertices not in these elementary meshes.
 - **labels** : to specify the labels of the elementary meshes on which to evaluate the function (default is all). A zero value is set on all vertices not in these elementary meshes.

Several examples are given in functions:

fc_simesh.demos.feval2D01(), **fc_simesh.demos.feval3D01()**, ...

We present now some very basic samples.

Sample 1 Let $g : \mathbb{R}^2 \mapsto \mathbb{R}$ defined by $g(x, y) = \cos(x)\sin(y)$. We propose in Listing 7 four approaches to defined this function for using with **feval** method.

Listing 7: **feval** method, four ways to defined a function

```

Output

```

3.4.4 eval method

Evaluates numerical datas or vectorized functions at vertices of the mesh. We denote by **Th** a **fc_simesh.siMesh** object and $n_q = Th.nq$ the total number of vertices.

- **res=Th.eval(data)** : the input parameter **data** could be

- a scalar,
- a handle to a vectorized function,
- a n_q -by-1 array,
- a 1-by- m cell array of mixed previous kinds, ($m \geq 1$).

The return value is a n_q -by-1 array if the input parameter `data` is not a cell array otherwise it's a n_q -by- m array.

- `res=Th.eval(data,key,value,...)` specifies function options using one or more `key,value` pair arguments. The string `key` options could be
 - `d` : to specify the `d`-simplicial elementary meshes on which to evaluate `data` (default `Th.d`). A zero value is set on all vertices not in these elementary meshes.
 - `labels` : to specify the labels of the elementary meshes on which to evaluate `data` (default is all). A zero value is set on all vertices not in these elementary meshes.

Several examples are given in functions:

`fc_simesh.demos.eval2D01()`, `siMesh.demos.eval3D01()`, ...

We present now some very basic samples.

Sample 1

```

g2=pi*ones(1,Th.nq);
g3=@(X) pi;

z1=Th.eval(g1);
z2=Th.eval(g2);
z3=Th.eval(g3);

fprintf('size(z1)=[%d,%d]\n',size(z1))
fprintf('size(z2)=[%d,%d]\n',size(z2))
fprintf('size(z3)=[%d,%d]\n',size(z3))
fprintf('max(abs(z2-z1))=%e\n',max(abs(z2-z1)))
fprintf('max(abs(z3-z1))=%e\n',max(abs(z3-z1)))
```

Output

```

3.4.5 `get_h` method

returns the maximum edges length of the mesh. We denote by `Th` a `fc_simesh.siMesh` object.

- `h=Th.get_h()`

3.4.6 `get_mesh` method

Returns a vertices array `q`, a connectivity array `me` and a `toGlobal` indices array.

- `[q,me,toGlobal]=Th.get_mesh()` : returns the global vertices array `q`, the connectivity array `me` (i.e. all the `Th.d`-simplices of the mesh). In this case, `toGlobal` is just `1:Th.nq`.
- `[q,me,toGlobal]=Th.get_mesh(key,value,...)` specifies function options using one or more `key,value` pair arguments. The string `key` options could be
 - `'d'` : to specify the `d`-simplicial elementary meshes to consider.
 - `'labels'` : to specify the labels of the elementary meshes to consider.

In this case, `toGlobal` is a 1-by-`length(q)` array (subset of `1:Th.nq`). If we denote by `qglob` the global vertices array then

$$qglob(:, \text{toGlobal}) == q$$

Several examples are given in functions:

`fc_simesh.demos.get_mesh2D()`, `siMesh.demos.get_mesh3D()`, `siMesh.demos.get_mesh3Ds()`

Listing 11: `get_mesh` method, four ways to defined a function

[q2,me2,toGlobal2]=Th.get_mesh('labels',2:2:8);
[q1,me1,toGlobal1]=Th.get_mesh('d',1,'labels',1:8);

fprintf('norm(q(:,toGlobal2)-q2,Inf)=%e\n',norm(q(:,toGlobal2)-q2,Inf))
fprintf('norm(q(:,toGlobal1)-q1,Inf)=%e\n',norm(q(:,toGlobal1)-q1,Inf))
```

Output

```
norm(q(:,toGlobal2)-q2,Inf)=0.000000e+00
norm(q(:,toGlobal1)-q1,Inf)=0.000000e+00
```

3.4.7 `get_nme` method

Returns the number of d -simplicial elements with $d = \mathcal{T}_h.d$ by default. We denote by `Th` a `fc_simesh.siMesh` object.

- `nme=Th.get_nme()` : returns the number of `Th.d`-simplicial elements in the mesh.
- `nme=Th.get_mesh(key,value,...)` specifies function options using one or more `key,value` pair arguments. The string `key` options could be
 - `'d'` : to specify the `d`-simplicial elementary meshes to consider.

- ‘**labels**’ : to specify the labels of the elementary meshes to consider.

Listing 12: `get_nme` method

```

meshfile=fc_oogmsh.gmsh.buildmesh3d('quart_sphere2',5);

3.4.8 `get_nq` method

Returns the number of vertices in the union of some elementary meshes. By default all the (`Th.d`)-simplicial elementary meshes are selected. We denote by `Th` a `fc_simesh.siMesh` object.

- `nq=Th.get_nq()` : returns the number of vertices in the union of the `Th.d`-simplicial elementary meshes.
- `nq=Th.get_nq(key,value,...)` specifies function options using one or more `key,value` pair arguments. The string `key` options could be
 - ‘**d**’ : to specify the **d**-simplicial elementary meshes to consider.
 - ‘**labels**’ : to specify the labels of the elementary meshes to consider.

3.4.9 `get_labels` method

Returns the labels of the d -simplicial elementary meshes. We denote by `Th` a `fc_simesh.siMesh` object.

- `labels=Th.get_labels(d)` : the labels of the d -simplicial elementary meshes.

Listing 14: `get_labels` method

3.4.10 `plotmesh` method

The `plotmesh` method displays the mesh or parts of the mesh defined by an `fc_simesh.siMesh` object.

Syntaxe

```
Th.plotmesh()
Th.plotmesh(Name, Value, ...)
```

Description

`Th.plotmesh()` displays all the (`Th.d`)-dimensional simplices elements of `Th`, a `fc_simesh.siMesh` object.

`Th.plotmesh(Name, Value, ...)` specifies function options using one or more `Name, Value` pair arguments. Options of first level are

- '**d**' : to specify the dimension of the simplices elements (default : **Th.d**)
- '**labels**' : to select the labels of the elements to display,
- '**color**' : to specify the color of the displayed mesh elements. (default : use one color by displayed mesh elements),
- '**inlegend**' : add a legend name to graph if true (default : **false**)
- '**bounds**' : If **true**, draw the borders of the selected elementaries mesh elements (only for 2-dimensional simplices). (default : **false**)
- '**cutPlane**' : cut mesh by n plans given by n -by-4 array P where the equation of the i -th cut plane is given by

$$P(i, 1)x + P(i, 2)y + P(i, 3)z + P(i, 4) = 0.$$

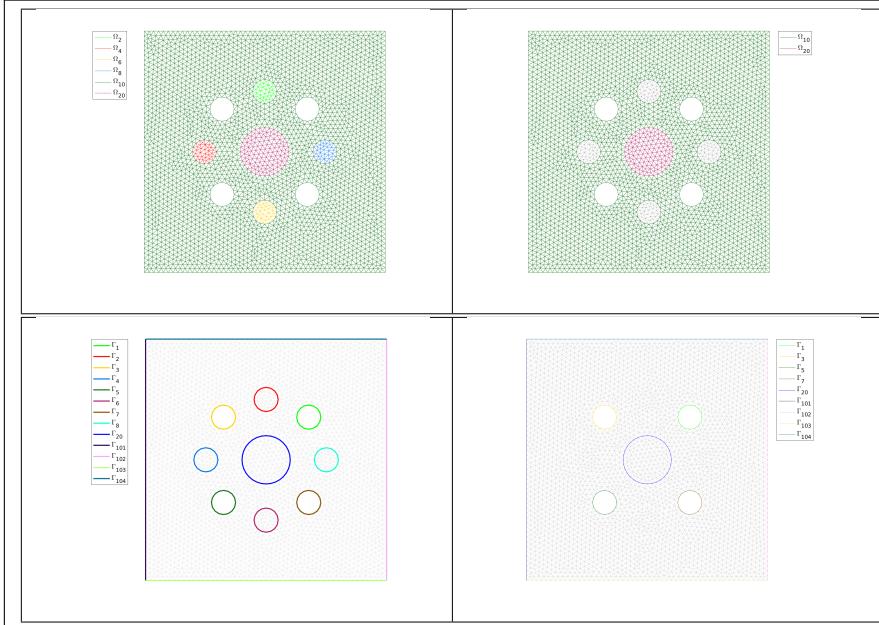

The normal vector $P(i, 1 : 3)$ pointed to the part of the mesh not displayed. (only for simplices in dimension 3) default : [] (no cut).

The options of second level depend on the type of elementaries mesh elements to represent.

One can use any option of the following functions according to the type of d -simplex to be represented.

- In dimension 3,
 - if $d == 3$, **patch** function is used,
 - if $d == 2$, **trimesh** function is used,
 - if $d == 1$, **plot3** function is used,
 - if $d == 0$, **plot3** function is used,
- In dimension 2,
 - if $d == 2$, **trimesh** function is used,
 - if $d == 1$, **plot** function is used,
 - if $d == 0$, **plot** function is used,
- In dimension 1,
 - if $d == 1$, **line** function is used,
 - if $d == 0$, **plot** function is used,

2D example The following example use the *.geo* file **condenser11.geo** which is in the directory **geodir** of the toolbox

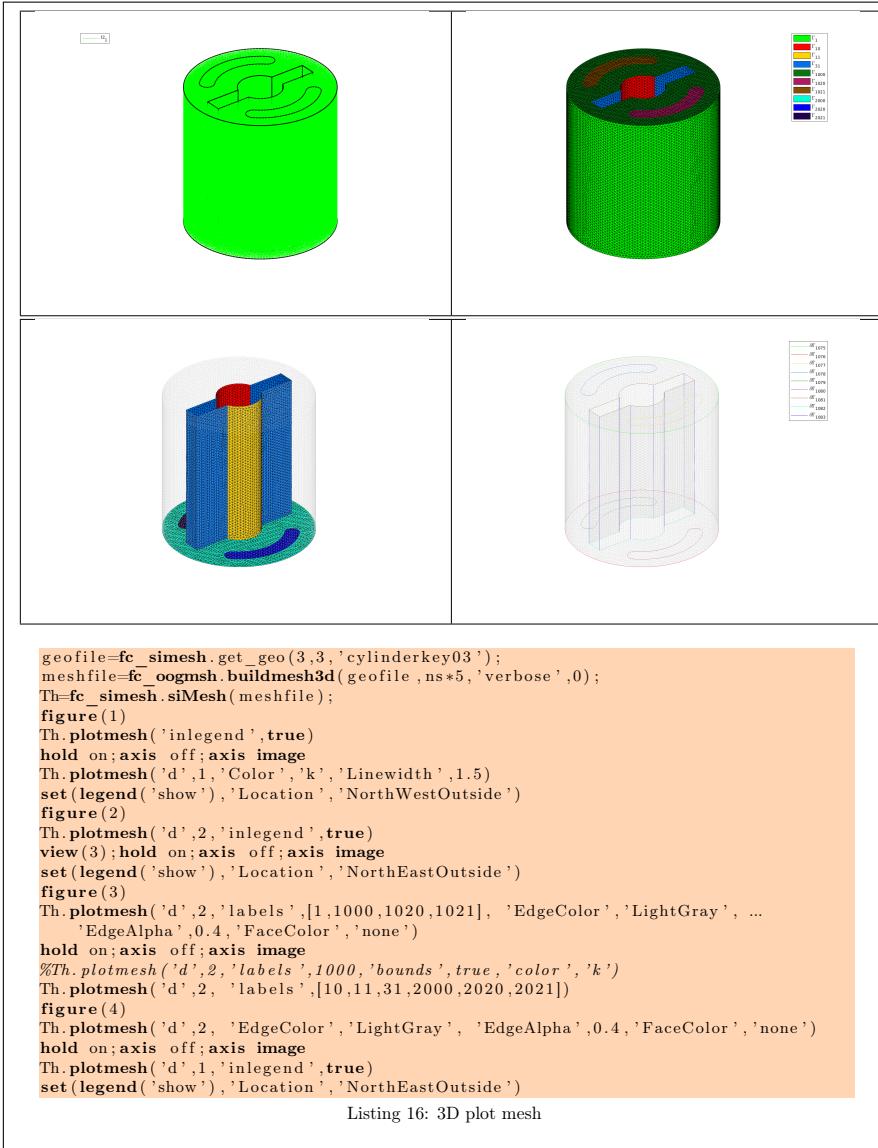

```

Listing 15: 2D mesh : **plotmesh** method

3D example The following example use the *.geo* file *cylinderkey.geo* which is in the directory **geodir** of the toolbox. This file contains description of a 3D mesh with simplices of dimensions 1, 2 and 3.

3D surface example The following example use the *.geo* file **demisphere5.geo** which is in the directory **geodir** of the toolbox. This file contains description of a 3D surface mesh with simplices of dimensions 1 and 2.

3.4.11 **plot** method

The **plot** method displays scalar datas on the mesh or parts of the mesh defined by an **fc_simesh.siMesh** object.

Syntaxe

Th.plot(u)
Th.plot(u,Name,Value, ...)

Description

Th.plot(u) displays data **u** on all the (**Th.d**)-dimensional simplices elements of **Th**, a **fc_simesh.siMesh** object. The data **u** is an 1D-array of size **Th.nq** or **Th.nqGlobal** or **Th.nqParent**.

`Th.plot(u,Name,Value, ...)` specifies function options using one or more `Name,Value` pair arguments. Options of first level are

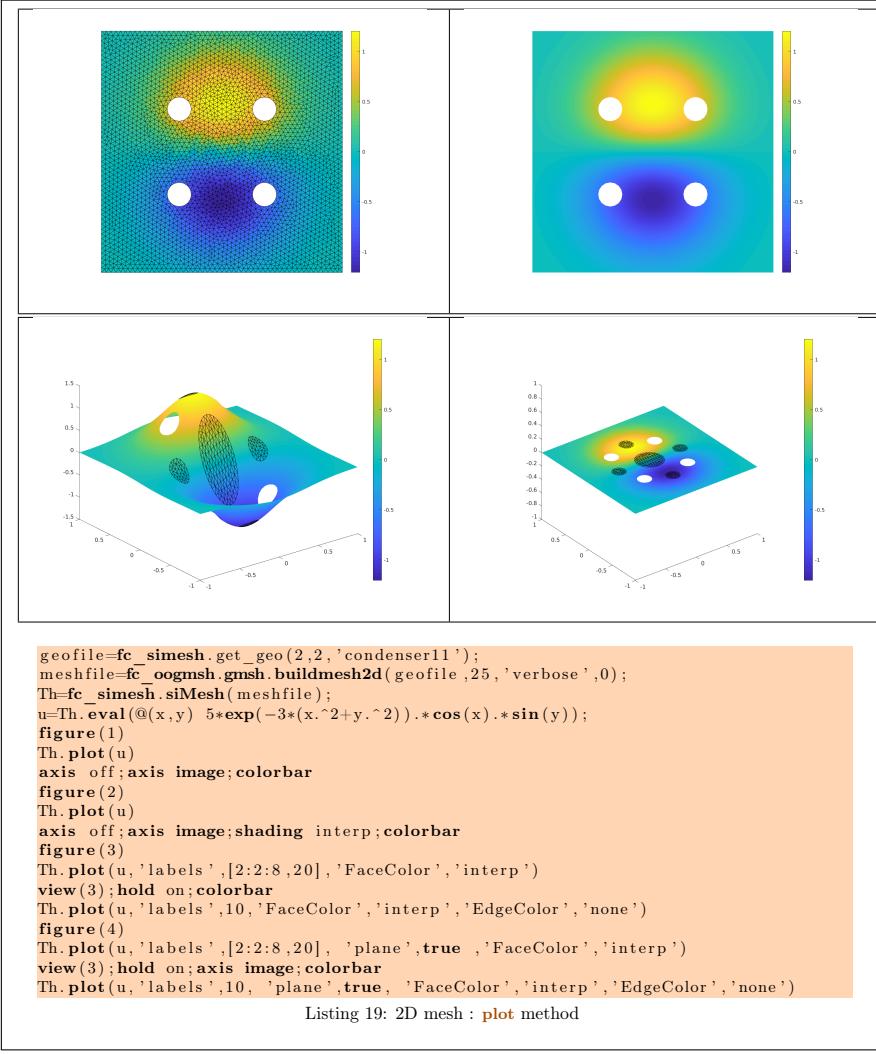

- '`d`' : to specify the dimension of the simplices elements (default : `Th.d`)
- '`labels`' : to select the labels of the elements to display data,
- '`plane`' : if true, made a 2D representation in the xy -plane, otherwise made a 3D representation with z -value set to `u` (default : `false`)

The options of second level depend on the type of elementaries mesh elements on which we want to represent datas.

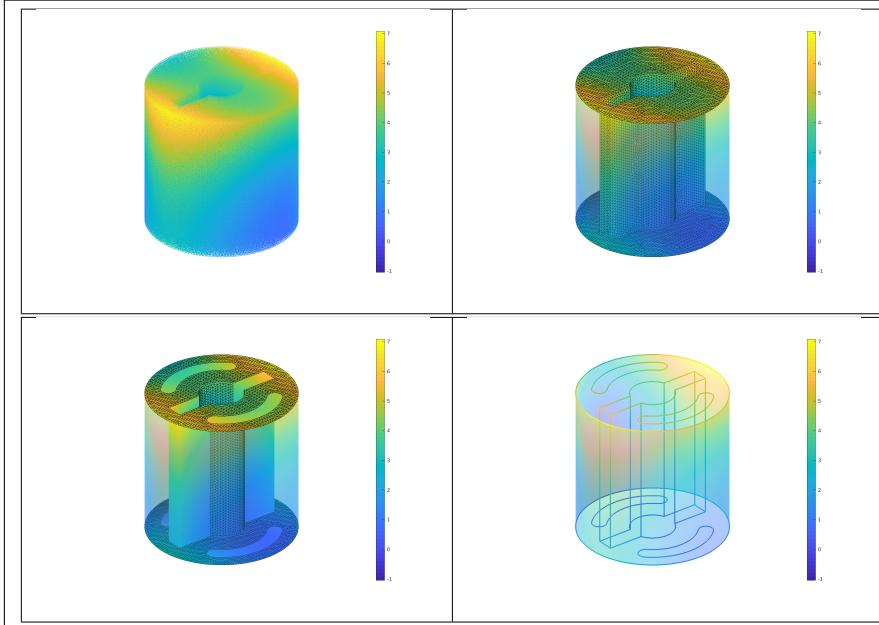

One can use any option of the following functions according to the type of d -simplex.

- In dimension 3, `patch` function is used for $d \in [1, 3]$.
- In dimension 2,
 - for $d == 2$, if '`plane`' option is true, `patch` function is used, otherwise it's `trisurf` function,
 - for $d == 1$, `patch` function is used.
- In dimension 1 and $d == 1$, `plot` function is used

2D example The following example use the `.geo` file `condenser11.geo` which is in the directory `geodir` of the toolbox.

Listing 20: 3D mesh : **plot** method

3D surface example The following example use the *.geo* file **demisphere5.geo** which is in the directory **geodir** of the toolbox. This file contains description of a 3D surface mesh with simplices of dimensions 1 and 2.

3.4.12 **plotiso** method

The **plotiso** method displays isolines from datas on the mesh or parts of the mesh defined by an **fc_simesh.siMesh** object. This function only works with 2-simplices in space dimension 2 or 3.

Syntaxe

Th.plotiso(u)
Th.plotiso(u,Name,Value, ...)

Description

Th.plotiso(u) displays data **u** on all the 2-dimensional simplices elements of **Th**, a **fc_simesh.siMesh** object.. The data **u** is an 1D-array of size **Th.nq** or **Th.nqGlobal** or **Th.nqParent**.

`Th.plotiso(u,key,value, ...)`] specifies function options using one or more `key,value` pair arguments. Options of first level are

- `'niso'` : to specify the number of isolines (default : 10)
- `'isorange'` : to specify the list of isovalues (default : empty)
- `'isocolorbar'` : if `true`, colorbar with isovalues is drawn (default : `false`)
- `'format'` : to specify the format of the isovalues on the colorbar (default : `'%g'`)
- `'labels'` : to select the labels of the elements to display data,
- `'plane'` : if true, isolines are in the xy -plane, otherwise isolines are in 3D with z -value set to `u` (default : `false`)
- `'color'` : to specify one color for all isolines (default : empty)
- `'mouse'` : if `true`, display information on clicked isoline (default : `false`)

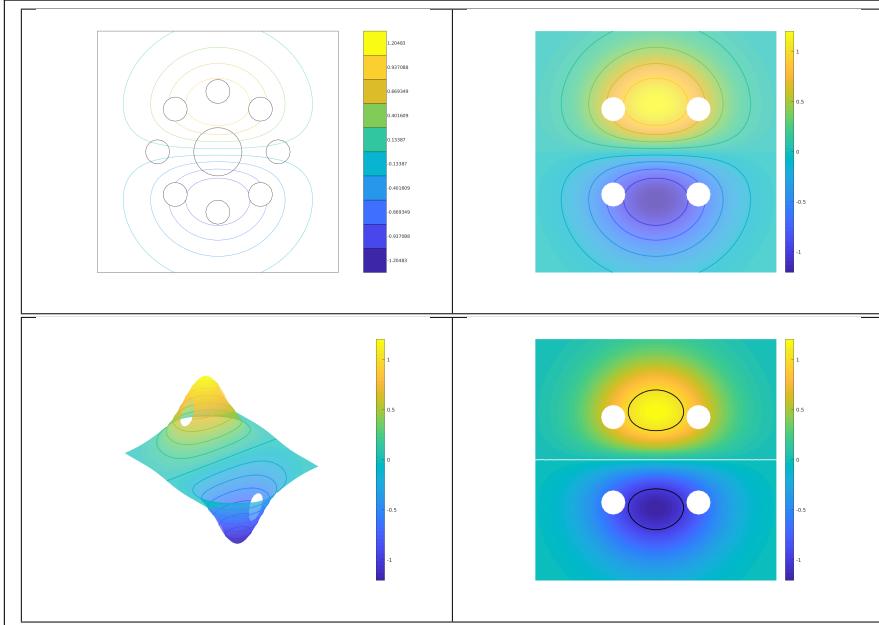

The options of second level are all options of

- `plot3` function in dimension 3 or in dimension 2 with `'plane'` option set to `false`
- `plot` function in 2 with `'plane'` option set to `true`

This function accepts until 4 output arguments :

- 1st output is the colors of the isolines
- 2nd output is the isovalues of the isolines
- 3th output is the handle of the colobar iso.
- 4th output is all the handles of the isolines as an 2D-array of dimension N-by-niso, where N is the number of 2-simplex elementary meshes where isolines are drawn.

2D example The following example use the `.geo` file `condenser11.geo` which is in the directory `geodir` of the toolbox.

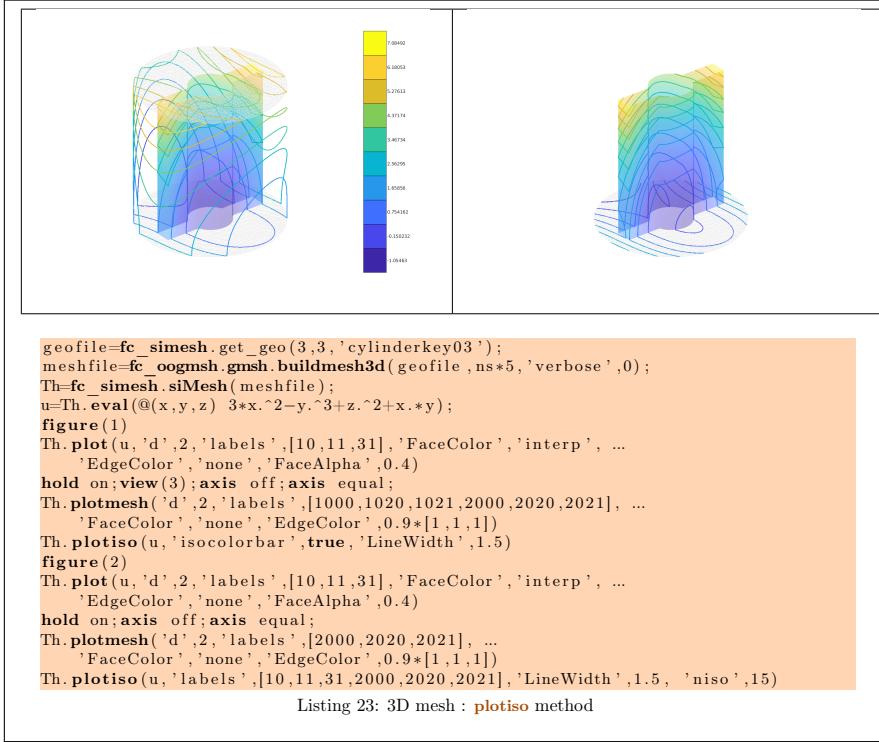

```

meshfile=fc_oogmsh.gmsh.buildmesh2d('condenser11',25,'verbose',0);
Th=fc_simesh.siMesh(meshfile);

3.4.13 slicemesh method

The **slicemesh** method displays intersection of a plane and a 3D mesh or parts of a 3D mesh defined by an **fc_simesh.siMesh** object.

Syntaxe

```
Th.slicemesh(P)
Th.slicemesh(P,Name,Value, ...)
```

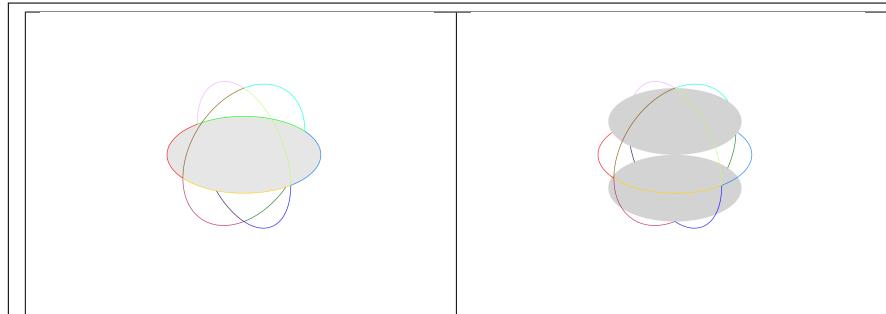

Description

Th.slicemesh(P) displays intersection of the plane defined by $P(1)x + P(2)y + P(3)z + P(4) = 0$ and all the 3-dimensional simplices elements of **Th**, a **fc_simesh.siMesh** object. To compute P one can use the function **fc_tools.graphics.PlaneCoefs** of the **ctools** toolbox. With this function, the array **P**, is obtained with **P=fc_tools.graphics.PlaneCoefs(Q,V)** where **Q** is a point in the plane and **V** is a vector orthogonal to it.

Th.slicemesh(P,Name,Value, ...) specifies function options using one or more **Name,Value** pair arguments. Options of first level are

- '**color**' : to specify the slice color (default : '**lightgrey**', **rgb**=[0.9,0.9,0.9])
- '**labels**' : to select the labels of the elements to intersect,

3D example The following example use the **.geo** file **ball18.geo** which is in the directory **geodir** of the toolbox. This file contains description of a 3D mesh with simplices of dimensions 1, 2 and 3.

```
meshfile=fc_oogmsh.buildmesh3d('ball18',ns*10,'verbose',0);
Th=fc_simesh.siMesh(meshfile);

3.4.14 slice method

The method **slice** method displays datas on the intersection of a plane and a 3D mesh or parts of a 3D mesh defined by an **fc_simesh.siMesh** object.

Syntaxe

```
Th.slice(u,P)
Th.slice(u,P,Name,Value, ...)
```

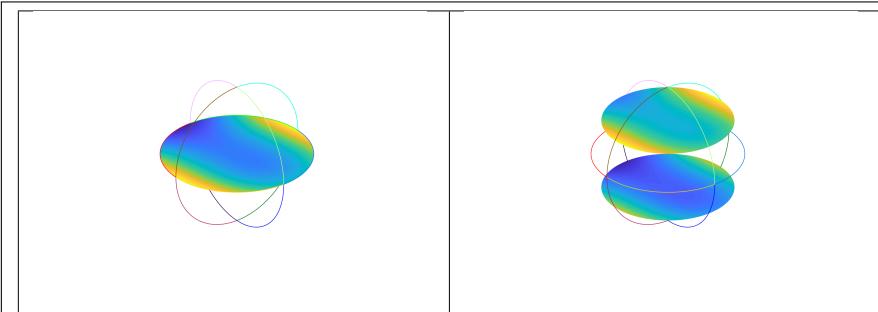

Description

Th.slice(u,P) displays **u** data on the intersection of the plane defined by $P(1)x + P(2)y + P(3)z + P(4) = 0$ and all the 3-dimensional simplices elements of **Th**, a **fc_simesh.siMesh** object. The data **u** is an 1D-array of size **Th.nq** or **Th.nqGlobal** or **Th.nqParent**. To compute **P** one can use the function **fc_tools.graphics.PlaneCoefs** of the **ctools** toolbox. With this function, the array **P**, is obtained with **P=fc_tools.graphics.PlaneCoefs(Q,V)** where **Q** is a point in the plane and **V** is a vector orthogonal to it.

Th.slice(u,P,Name,Value, ...) specifies function options using one or more **Name,Value** pair arguments. Options of first level are

- '**labels**' : to select the labels of the elements to intersect,

3D example The following example use the **.geo** file **ball18.geo** which is in the directory **geodir** of the toolbox. This file contains description of a 3D mesh with simplices of dimensions 1, 2 and 3.

```
meshfile=fc_oogmsh.buildmesh3d('ball18',ns*10,'verbose',0);

Listing 26: 3D mesh :**slice** method

3.4.15 sliceiso method

The **sliceiso** method displays isolines of data on the intersection of a plane and a 3D mesh or parts of a 3D mesh defined by an **fc_simesh.siMesh** object.

Syntaxe

```
Th.sliceiso(u,P)
Th.sliceiso(u,P,Name,Value, ...)
```

Description

Th.sliceiso(u,P) displays **u** data as isolines on the intersection of the plane defined by $P(1)x + P(2)y + P(3)z + P(4) = 0$ and all the 3-dimensional simplices elements of **Th**, a **fc_simesh.siMesh** object. The data **u** is an 1D-array of size **Th.nq** or **Th.nqGlobal** or **Th.nqParent**. To compute **P** one can use the function **fc_tools.graphics.PlaneCoefs** of the **ctools** toolbox. With this function, the array **P**, is obtained with **P=fc_tools.graphics.PlaneCoefs(Q,V)** where **Q** is a point in the plane and **V** is a vector orthogonal to the plane.

Th.sliceiso(u,P,key,value, ...) allows additional key/value pairs to be used when displaying **u**. The key strings could be

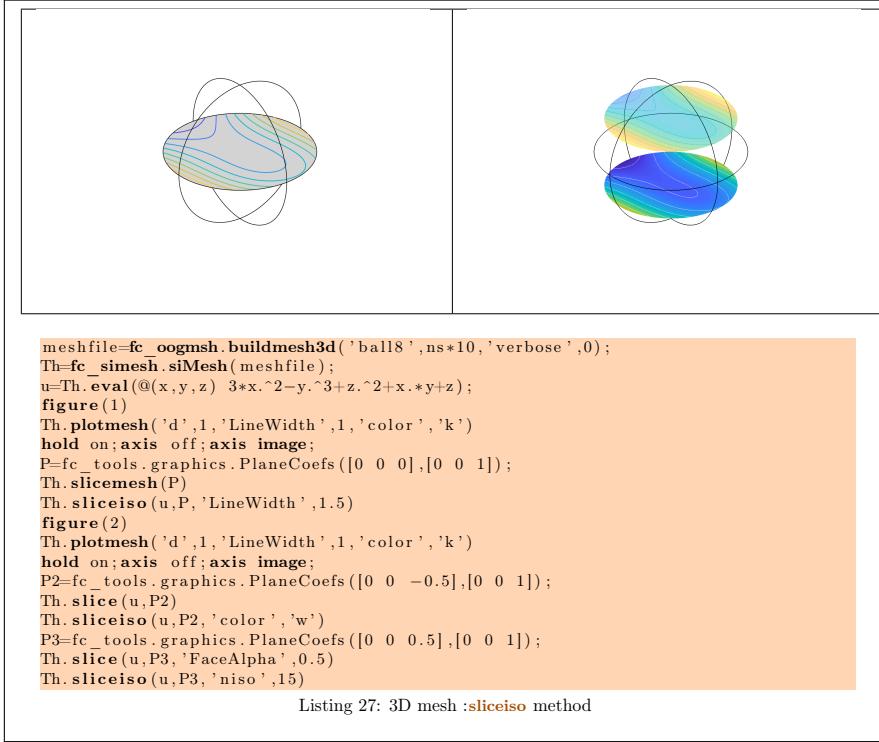

- '**labels**' : to select the labels of the elements to intersect,
- '**niso**' : to specify the number of isolines (default : 10)
- '**isorange**' : to specify the list of isovalues (default : empty)
- '**color**' : to specify one color for all isolines (default : empty)
- '**isocolorbar**' : if true display a colorbar. Default is false.
- '**format**' : to specify the format of the isovalues print in the colorbar. Default is '**%g**'.

For key strings, one could also used any options of the **plot3** function.

This function accepts until 4 output arguments :

- 1st output is the colors of the isolines
- 2nd output is the isovalues of the isolines
- 3th output is the handle of the colobar iso.
- 4th output is all the handles of the isolines as an 2D-array of dimension N-by-niso, where N is the number of elementary meshes where isolines are drawn.

3D example The following example use the **.geo** file **ball8.geo** which is in the directory **geodir** of the toolbox. This file contains description of a 3D mesh with simplices of dimensions 1, 2 and 3.

3.4.16 **plotquiver** method

The **plotquiver** method displays vector field datas on the mesh or parts of the mesh defined by an **fc_simesh.siMesh** object.

Syntaxe

```

Th.plotquiver(V)
Th.plotquiver(V,Key,Value, ...)

```

Description

Th.plotquiver(V) displays vector field **U** on all the **d**-dimensional simplices elements in dimension $d = 2$ or $d = 3$. The data **V** is an 2D-array of size **Th.nq**-by-**d** or 2-by-**Th.nq**.

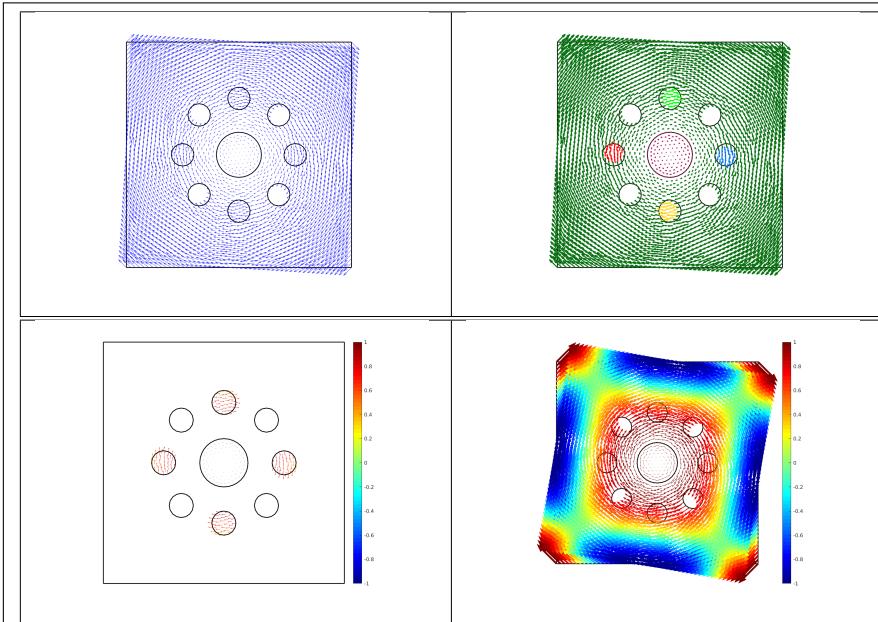

Th.plotquiver(V,Key,Value, ...) specifies function options using one or more **Key,Value** pair arguments. Options of first level are

- '**labels**' : to select the labels of the elements to display data,
- '**freq**' : quiver frequencie, (default : 1)
- '**scale**' : quiver scale, (default : ...)
- '**colordata**' : set colors on each quiver (default : empty).

The options of second level depend on space dimension and '**colordata**' option. One can use any option of the following functions

- **quiver** function in dimension 2 with an empty 'colordata'
- **quiver3** function in dimension 3 with an empty 'colordata'
- **vfield3** function in dimension 2 or 3 with 'colordata' set to an 1D-array of length **Th.nq**.

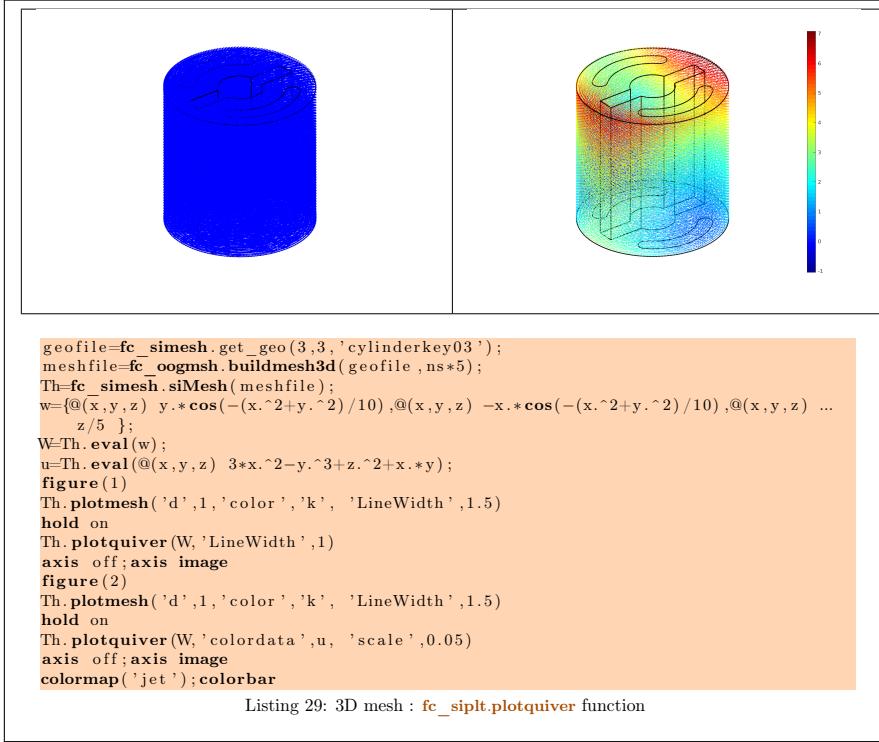

2D example The following example use the *.geo* file **condenser11.geo**.

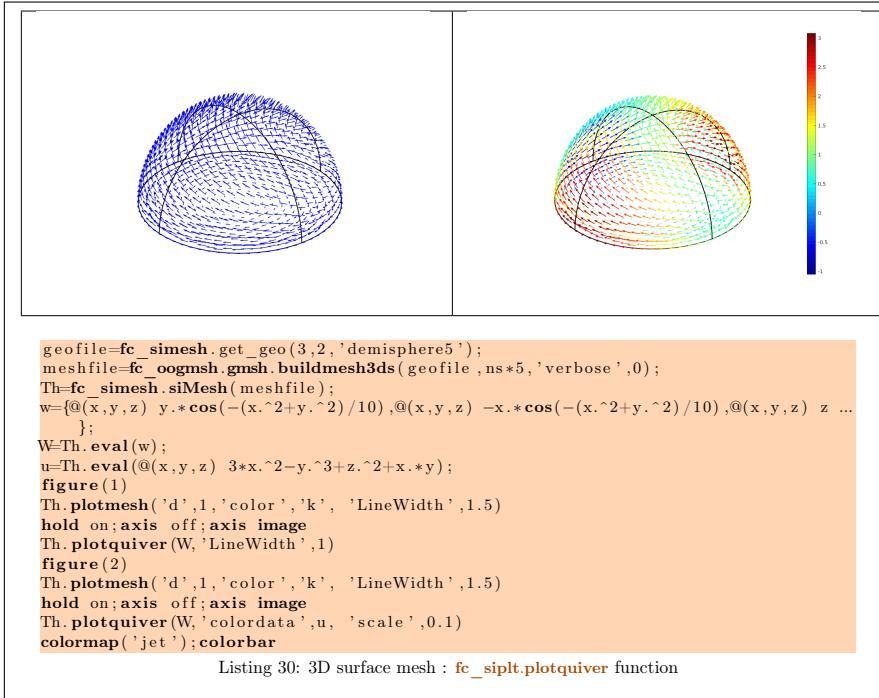

```
geofile=fc_simesh.get_geo(2,2,'condenser11');
meshfile=fc_oogmsh.buildmesh2d(geofile,25,'verbose',0);
Th=fc_simesh.siMesh(meshfile);
u=@(x,y) cos(pi*x.^2).*cos(pi*y.^2);
U=Th.eval(u);
w=@(x,y) y.*cos(-(x.^2+y.^2)/10),@(x,y) -x.*cos(-(x.^2+y.^2)/10);
W=Th.eval(w);

3.5 Hypercube as a `fc_simesh.siMesh` object

The function `fc_simesh.hypercube` allows to create a `fc_simesh.siMesh` object representing an hypercube in any dimension. It uses the `FC-HYPERMESH` Matlab toolbox.

- `Th=fc_simesh.hypercube(dim,N)` : return a `fc_simesh.siMesh` object representing an hypercube in dimension `dim` and ...
- `Th=fc_simesh.hypercube(dim,N,Key,Value,...)` :

3.5.1 2D hypercube

In Listing 31 a usage example generating a 2D hypercube as a `fc_simesh.siMesh` object is given. This `fc_simesh.siMesh` object is representing in Figure 4 by using the `FC-SIPLT` toolbox.
