Abstract

FC-VFEMP₁ is an object-oriented Matlab toolbox dedicated to solve scalar or vector boundary value problem (BVP) by \mathbb{P}_1 -Lagrange finite element methods in any space dimension. It integrates the FC-SIMESH toolbox which allows a great flexibility in graphical representations of the meshes and datas on the meshes.

This toolbox also contains the techniques of vectorization presented in [2] and extended in [1] and allows good performances when using finite elements methods.

Chapter 1

Generic Boundary Value Problems

The notations of [4] are employed in this section and extended to the vector case.

1.1 Scalar boundary value problem

Let Ω be a bounded open subset of \mathbb{R}^d , $d \ge 1$. The boundary of Ω is denoted by Γ .

We denote by $\mathcal{L}_{\mathbb{A},\boldsymbol{b},\boldsymbol{c},a_0} = \mathcal{L}: H^2(\Omega) \longrightarrow L^2(\Omega)$ the second order linear differential operator acting on scalar fields defined, $\forall u \in H^2(\Omega)$, by

$$\mathcal{L}_{\mathbb{A}, \boldsymbol{b}, \boldsymbol{c}, a_0}(u) \stackrel{\mathsf{def}}{=} -\operatorname{div}\left(\mathbb{A}\,\boldsymbol{\nabla}\,u\right) + \operatorname{div}\left(\boldsymbol{b}u\right) + \langle\boldsymbol{\nabla}\,u, \boldsymbol{c}\rangle + a_0u \tag{1.1}$$

where $\mathbb{A} \in (L^{\infty}(\Omega))^{d \times d}$, $\mathbf{b} \in (L^{\infty}(\Omega))^d$, $\mathbf{c} \in (L^{\infty}(\Omega))^d$ and $a_0 \in L^{\infty}(\Omega)$ are given functions and $\langle \cdot, \cdot \rangle$ is the usual scalar product in \mathbb{R}^d . We use the same notations as in the chapter 6 of [4] and we note that we can omit either div $(\mathbf{b}u)$ or $\langle \nabla u, \mathbf{c} \rangle$ if \mathbf{b} and \mathbf{c} are sufficiently regular functions. We keep both terms with \mathbf{b} and \mathbf{c} to deal with more boundary conditions. It should be also noted that it is important to preserve the two terms \mathbf{b} and \mathbf{c} in the generic formulation to enable a greater flexibility in the choice of the boundary conditions.

Let Γ^D , Γ^R be open subsets of Γ , possibly empty and $f \in L^2(\Omega)$, $g^D \in H^{1/2}(\Gamma^D)$, $g^R \in L^2(\Gamma^R)$, $a^R \in L^\infty(\Gamma^R)$ be given data.

A scalar boundary value problem is given by

₹Scalar BVP 1 : generic problem

Find $u \in H^2(\Omega)$ such that

$$\mathcal{L}(u) = f \qquad \qquad \text{in } \Omega, \tag{1.2}$$

$$u = g^D \qquad \text{on } \Gamma^D, \tag{1.3}$$

$$\frac{\partial u}{\partial n_C} + a^R u = g^R \qquad \text{on } \Gamma^R. \tag{1.4}$$

The **conormal derivative** of u is defined by

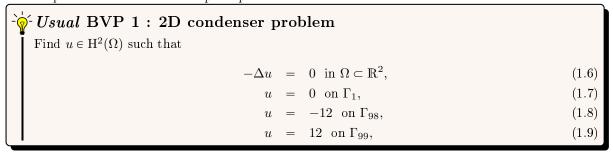

$$\frac{\partial u}{\partial n_{\mathcal{L}}} \stackrel{\mathsf{def}}{=} \langle \mathbb{A} \nabla u, \boldsymbol{n} \rangle - \langle \boldsymbol{b} u, \boldsymbol{n} \rangle \tag{1.5}$$

The boundary conditions (1.3) and (1.4) are respectively **Dirichlet** and **Robin** boundary conditions. **Neumann** boundary conditions are particular Robin boundary conditions with $a^R \equiv 0$.

Scalar BVP 4

To have an outline of the FC-VFEM \mathbb{P}_1 toolbox, a first and simple problem is quickly present. Explanations will be given in next sections.

The problem to solve is the Laplace problem for a condenser.

where Ω and its boundaries are given in Figure 1.1.

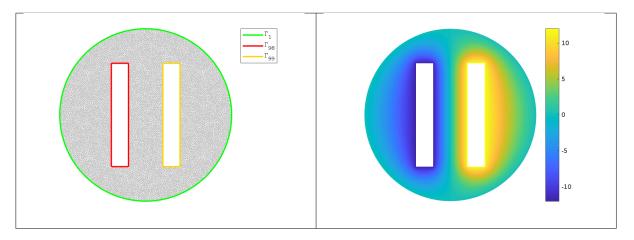

Figure 1.1: 2D condenser mesh and boundaries (left) and numerical solution (right)

The problem (1.6)-(1.9) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

```
Scalar BVP 2: 2D condenser problem

Find u \in H^2(\Omega) such that

\mathcal{L}(u) = f \qquad \text{in } \Omega,
u = g^D \qquad \text{on } \Gamma^D = \Gamma_1 \cup \Gamma_{98} \cup \Gamma_{99}.
where \mathcal{L} := \mathcal{L}_{1,0,0,0}, f \equiv 0, and
g^D := 0 \text{ on } \Gamma_1, \ g^D := -12 \text{ on } \Gamma_{98}, \ g^D := +12 \text{ on } \Gamma_{99}
```

In Listing 19 a complete code is given to solve this problem.

```
meshfile=gmsh.buildmesh2d('condenser',10); % generate mesh
    Th=siMesh(meshfile); % read mesh
    \mathbf{Lop} = \mathbf{Loperator}(2, 2, \{1, 0; 0, 1\}, [], [], []);
    pde=PDEelt(Lop);
    bvp=BVP(Th,pde);
    bvp.setDirichlet(1, 0.);
    bvp.setDirichlet (98, -12.);
    bvp.setDirichlet(99, +12.);
    U = bvp.solve();
    % Graphic parts
10
11
    figure(1)
    Th.plotmesh('color', 0.7*[1,1,1])
    hold on
    Th.plotmesh('d',1,'Linewidth',2,'legend',true)
    axis off,axis image
15
    figure(2)
16
```

Th.plot(U,'edgecolor','none','facecolor','interp') axis off, axis image; colorbar

Listing 1.1: Complete Matlab code to solve the 2D condenser problem with graphical representations

Obviously, more complex problems will be studied in section ?? and complete explanations on the code will be given in next sections. Previously, the vector BVP is formally presented with an application.

1.2 Vector boundary value problem

Let $m \ge 1$ and \mathcal{H} be the m-by-m matrix of second order linear differential operators defined by

$$\begin{cases}
\mathcal{H} : (\mathbf{H}^{2}(\Omega))^{m} \longrightarrow (L^{2}(\Omega))^{m} \\
\mathbf{u} = (\mathbf{u}_{1}, \dots, \mathbf{u}_{m}) \longmapsto \mathbf{f} = (\mathbf{f}_{1}, \dots, \mathbf{f}_{m}) \stackrel{\mathsf{def}}{=} \mathcal{H}(\mathbf{u})
\end{cases} (1.10)$$

where

$$\boldsymbol{f}_{\alpha} = \sum_{\beta=1}^{m} \mathcal{H}_{\alpha,\beta}(\boldsymbol{u}_{\beta}), \quad \forall \alpha \in [1, m],$$
(1.11)

with, for all $(\alpha, \beta) \in [1, m]^2$,

$$\mathcal{H}_{\alpha,\beta} \stackrel{\mathsf{def}}{=} \mathcal{L}_{\mathbb{A}^{\alpha,\beta}, \boldsymbol{b}^{\alpha,\beta}, \boldsymbol{c}^{\alpha,\beta}, a_{\alpha}^{\alpha,\beta}} \tag{1.12}$$

and $\mathbb{A}^{\alpha,\beta} \in (L^{\infty}(\Omega))^{d \times d}$, $\boldsymbol{b}^{\alpha,\beta} \in (L^{\infty}(\Omega))^d$, $\boldsymbol{c}^{\alpha,\beta} \in (L^{\infty}(\Omega))^d$ and $a_0^{\alpha,\beta} \in L^{\infty}(\Omega)$ are given functions. We can also write in matrix form

$$\mathcal{H}(\boldsymbol{u}) = \begin{pmatrix} \mathcal{L}_{\mathbb{A}^{1,1},\boldsymbol{b}^{1,1},\boldsymbol{c}^{1,1},a_0^{1,1}} & \cdots & \mathcal{L}_{\mathbb{A}^{1,m},\boldsymbol{b}^{1,m},\boldsymbol{c}^{1,m},a_0^{1,m}} \\ \vdots & \ddots & \vdots \\ \mathcal{L}_{\mathbb{A}^{m,1},\boldsymbol{b}^{m,1},\boldsymbol{c}^{m,1},a_0^{m,1}} & \cdots & \mathcal{L}_{\mathbb{A}^{m,m},\boldsymbol{b}^{m,m},\boldsymbol{c}^{m,m},a_0^{m,m}} \end{pmatrix} \begin{pmatrix} \boldsymbol{u}_1 \\ \vdots \\ \boldsymbol{u}_m \end{pmatrix}.$$
(1.13)

We remark that the \mathcal{H} operator for m=1 is equivalent to the \mathcal{L} operator.

For $\alpha \in [\![1,m]\!]$, we define Γ^D_α and Γ^R_α as open subsets of Γ , possibly empty, such that $\Gamma^D_\alpha \cap \Gamma^R_\alpha = \emptyset$. Let $\mathbf{f} \in (L^2(\Omega))^m$, $g^D_\alpha \in \mathrm{H}^{1/2}(\Gamma^D_\alpha)$, $g^R_\alpha \in L^2(\Gamma^R_\alpha)$, $a^R_\alpha \in L^\infty(\Gamma^R_\alpha)$ be given data. A vector boundary value problem is given by

₹ Vector BVP 1 : generic problem

Find $\boldsymbol{u} = (\boldsymbol{u}_1, \dots, \boldsymbol{u}_m) \in (\mathrm{H}^2(\Omega))^m$ such that

$$\mathcal{H}(\boldsymbol{u}) = \boldsymbol{f} \qquad \text{in } \Omega, \tag{1.14}$$

$$\mathbf{u}_{\alpha} = g_{\alpha}^{D}$$
 on Γ_{α}^{D} , $\forall \alpha \in [1, m]$, (1.15)

$$\frac{\partial \mathbf{u}}{\partial n_{\mathcal{H}_{\alpha}}} + a_{\alpha}^{R} \mathbf{u}_{\alpha} = g_{\alpha}^{R} \qquad \text{on } \Gamma_{\alpha}^{R}, \ \forall \alpha \in [1, m],$$

$$(1.16)$$

where the α -th component of the **conormal derivative** of \boldsymbol{u} is defined by

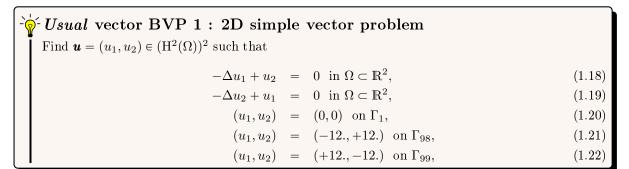

$$\frac{\partial \boldsymbol{u}}{\partial n_{\mathcal{H}_{\alpha}}} \stackrel{\text{def}}{=} \sum_{\beta=1}^{m} \frac{\partial \boldsymbol{u}_{\beta}}{\partial n_{\mathcal{H}_{\alpha,\beta}}} = \sum_{\beta=1}^{m} \left(\left\langle \mathbb{A}^{\alpha,\beta} \nabla \boldsymbol{u}_{\beta}, \boldsymbol{n} \right\rangle - \left\langle \boldsymbol{b}^{\alpha,\beta} \boldsymbol{u}_{\beta}, \boldsymbol{n} \right\rangle \right). \tag{1.17}$$

The boundary conditions (1.16) are the **Robin** boundary conditions and (1.15) is the **Dirichlet** boundary condition. The Neumann boundary conditions are particular Robin boundary conditions

In this problem, we may consider on a given boundary some conditions which can vary depending on the component. For example we may have a Robin boundary condition satisfying $\frac{\partial \mathbf{u}}{\partial n_{\mathcal{H}_1}} + a_1^R \mathbf{u}_1 = g_1^R$ and a Dirichlet one with $\mathbf{u}_2 = g_2^D$.

Vector BVP 6

To have an outline of the FC-VFEMP₁ toolbox, a second and simple problem is quickly present.

where Ω and its boundaries are given in Figure 1.1.

The problem (1.18)-(1.22) can be equivalently expressed as the vector BVP (1.2)-(1.4):

```
Vector BVP 2: 2D simple vector problem

Find \mathbf{u} = (u_1, u_2) \in (\mathrm{H}^2(\Omega))^2 such that

\mathcal{H}(\mathbf{u}) = \mathbf{f} \qquad \qquad \text{in } \Omega,
u_1 = g_1^D \qquad \qquad \text{on } \Gamma^D = \Gamma_1 \cup \Gamma_{98} \cup \Gamma_{99},
u_2 = g_2^D \qquad \qquad \text{on } \Gamma^D = \Gamma_1 \cup \Gamma_{98} \cup \Gamma_{99},
where

\mathcal{H} := \begin{pmatrix} \mathcal{L}_{\mathbb{I}}, \mathbf{o}, \mathbf{o}, 0 & \mathcal{L}_{0}, \mathbf{o}, \mathbf{o}, 1 \\ \mathcal{L}_{0}, \mathbf{o}, \mathbf{o}, 1 & \mathcal{L}_{\mathbb{I}}, \mathbf{o}, \mathbf{o}, 0 \end{pmatrix}, \text{ as } \mathcal{H} \begin{pmatrix} u_1 \\ u_2 \end{pmatrix} = \begin{pmatrix} -\Delta & 1 \\ 1 & -\Delta \end{pmatrix} \begin{pmatrix} u_1 \\ u_2 \end{pmatrix}
f \equiv 0,
and
g_1^D = g_2^D := 0 \text{ on } \Gamma_1, \ g_1^D := -12, \ g_2^D := +12 \text{ on } \Gamma_{98}, \ g_1^D := +12, \ g_2^D := -12 \text{ on } \Gamma_{99}
```

In Listing 21 a complete code is given to solve this problem. Numerical solutions are given in Figure 1.2.

```
meshfile=gmsh.buildmesh2d('condenser',10); % generate mesh
    Th=siMesh(meshfile); % read mesh
   Hop = Hoperator(2,2,2);
    Hop.set([1,2],[1,2],Loperator(2,2,\{1,[];[],1\},[],[],[]));
    Hop.set([1,2],[2,1],Loperator(2,2,[],[],[],[],1));
    pde=PDEelt(Hop);
6
    bvp=BVP(Th,pde);
    bvp.setDirichlet( 1, 0.,1:2);
    bvp.setDirichlet( 98, {-12,+12},1:2);
    bvp.setDirichlet(99, {+12,-12},1:2);
10
    U=bvp.solve('split',true);
11
    % Graphic parts
12
    figure(1)
13
    Th.plot(U\{1\})
14
    axis image; axis off; shading interp
15

```

Listing 1.2: Complete Matlab code to solve the funny 2D vector problem with graphical representations

Vector BVP 7

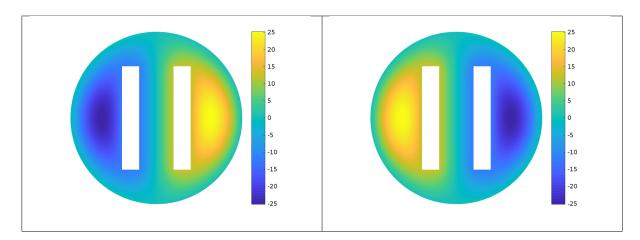

Figure 1.2: Funny vector BVP, u_1 numerical solution (left) and u_2 numerical solution (right)

Obviously, more complex problems will be studied in section ?? and complete explanations on the code will be given in next sections.

In the following of the report we will solve by a \mathbb{P}_1 -Lagrange finite element method scalar B.V.P. (1.2) to (1.4) and vector B.V.P. (1.14) to (1.16) without additional restrictive assumption.

Chapter 2

Matlab objects

2.1 Fdata object

This object is used to create the datas associated with the scalar boundary value problem (1.2)-(1.4) or vector boundary value problem (1.14)-(1.16).

2.2 Loperator Object

The object Loperator is used to create the operator $\mathcal{L}_{\mathbb{A},\boldsymbol{b},\boldsymbol{c},a_0}$ defined in (1.1). Its main properties are

d	:	integer, space dimension.
A	;	array of d-by-d cells. Used to store the \mathbb{A} functions such that $A\{i,j\} \leftarrow \mathbb{A}_{i,j}$ Each cell contains a Fdata object or is empty for value.
b	:	array of d-by-1 cells. Used to store the b functions such that $b\{i\} \leftarrow b_i$. Each cell contains a Fdata object or is empty for value.
С	:	array of d-by-1 cells. Used to store the c functions such that $c\{i\} \leftarrow c_i$. Each cell contains a Fdata object or is empty for value.
a0	:	a Fdata object or empty for 0 value Used to store the a_0 function such that $a_0 \leftarrow a_0$.
order	:	integer order of the operator: 2 if A is not empty, 1 if A is empty and b or c not empty, 0 if A, b and c ar empty.

2.2.1 Constructor

Its contructor are

```
obj=Loperator()
obj=Lopertor(dim,d,A,b,c,a0)
```

Description

```
obj=Loperator() create an empty operator.
```

```
obj = Loperator(dim,d,A,b,c,a0) ...
```

                                                       in \mathbb{R}
                                                                       Lop = Loperator(1,1,\{1\},[],[],1)
                                                       in \mathbb{R}^2
                                                                       Lop = Loperator(2, 2, \{1, []; [], 1\}, [], [], 1)
                                                       in \mathbb{R}^3
                                                                       Lop = Lop  erator (3,3,\{1,[],[],[],1,[],[],1\},[],[],1)
In R^2, -\Delta u + (1 + \cos(x + y))u := \mathcal{L}_{\mathbb{I}, \mathbf{O}, \mathbf{O}, (x,y) \mapsto (1 + \cos(x + y))}
                                                        Lop = Lop \, erator(2, 2, \{1, [], [], 1\}, [], [], @(x, y) 1 + cos(x + y))
```

2.2.2 Methods

apply function

2.3 Hoperator Object

The object Hoperator is used to create the operator \mathcal{H} defined in (1.10). Its main properties are

```
Properties of Hoperator object

d: integer, space dimension.

m: integer

H: array of d-by-d cells.

Used to store the \mathcal{H} operators such that \mathbf{H}\{i,j\} \leftarrow \mathcal{H}_{i,j}, \ \forall i,j \in [\![1,m]\!]. Each cell contains a Loperator object or an empty value.
```

2.3.1 Constructor

Its contructor are

```
obj=Hoperator()
obj=Hoperator(d,s,m)
```

Description

obj=Hoperator() create an empty operator with all dimensions set to 0.

obj=Hopertor(d,s,m) create an empty/null operator with the given dimensions.

Samples

In \mathbb{R}^2 , with $\mathbf{u} = (u_1, u_2)$ the operator \mathcal{H} defined by

$$\mathcal{H}(\boldsymbol{u}) \stackrel{\mathsf{def}}{=} \begin{pmatrix} -\Delta u_1 + u_2 \\ u_1 - \Delta u_2 \end{pmatrix}$$

could be written as

$$\mathcal{H} \begin{pmatrix} u_1 \\ u_2 \end{pmatrix} = \begin{pmatrix} -\Delta & 1 \\ 1 & -\Delta \end{pmatrix} \begin{pmatrix} u_1 \\ u_2 \end{pmatrix}$$

and then

$$\mathcal{H} = egin{pmatrix} \mathcal{L}_{\mathbb{I}, oldsymbol{O}, oldsymbol{O},$$

```
1  Hop=Hoperator(2,2,2);
2  Lop1=Loperator(2,2,{1,[];[],1},[],[],[]);
3  Lop2=Loperator(2,2,[],[],[],1);
4  Hop.set(1,1,Lop1);Hop.set(2,2,Lop1);
5  Hop.set(1,2,Lop2);Hop.set(2,1,Lop2);
```

or

- $\begin{array}{ll} {}_{1} & \textbf{Hop=Hoperator}(2,2,2); \\ {}_{2} & \textbf{Hop.set}([1,2],[1,2], \textbf{Loperator}(2,2,\{1,[];[],1\},[],[],[])); \end{array}$
- ³ Hop.set([1,2],[2,1],Loperator([2,2,[],[],[],1));

2.3.2 Methods

set function

zeros function

opStiffElas function

2.4 PDEelt object

This object is used to create the scalar PDE (1.2) or the vector PDE (1.14):

$$\mathcal{L}(u) = f \text{ or } \mathcal{H}(\boldsymbol{u}) = \boldsymbol{f}.$$

Its main properties are

Properties of PDEelt object						
\$ d	:	integer, space dimension.				
> m	:	integer				
Op	:	Loperator or Hoperator object.				
f	:	(cells of) Fdata object or empty. Used to store the right-hand side of the PDE. If Op is an Loperator object then f is an Fdata object or is empty. If Op is an Hoperator object then f is a cell array of Op.m Fdata object or empty value.				

Its contructor are

```
obj=PDEelt()
obj=PDEelt(Op)
obj=PDEelt(Op,f)
```

Description

```
obj=PDEelt() create an empty object.
```

```
obj=PDEelt(Op) create the PDE with f \equiv 0: i.e. Op(u)=0
```

obj=PDEelt(Op,f) create the PDE Op(u)=f. If Op is an Hoperator object then f must be a cell array of length Hoperator.m.

Samples

```
In \mathbb{R}^2, -\Delta u + u = f, with f(x, y) = x \sin(x + y)
```

```
Lop=Loperator(2,2,{1,[];[],1},[],[],1);

f=@(x,y) \ x.*sin(x+y);

pde=PDEelt(Lop,f);
```

The f function must be written in a vectorized form.

2.5 BVP object

The object BVP is used to create a scalar boundary value problem (1.2)-(1.4) or a vector boundary value problem (1.14)-(1.16). The usage of this object is strongly correlated with good comprehension of the FC-SIMESH toolbox and and more particularly with the siMesh object.

The properties of the object BVP are

```
Properties of BVP object

d : integer, space dimension.
m : integer, system of m PDEs.

Th : a siMesh object
pdes : Th.nsTh-by-1 cell array.
Used to store the PDE associated with each submesh
Th.sTh{i}. If pdes{i} is empty then there is no PDE
defined on Th.sTh{i}.
```

2.5.1 Constructor

Its contructor are

2.5.BVP object

```
obj=BVP()
obj=BVP(Th,pde)
obj=BVP(Th,pde,labels)
```

Description

|obj=BVP()| create an empty BVP object.

obj=BVP(Th,pde) create a BVP object with PDE's defined by pde object on all submeshes of index Th.find(pde.d) i.e. on all submeshes such that Th.sTh{i}==pde.d. By default, homogeneous Neumann boundary conditions are set on all boundaries.

obj=BVP(Th,pde,labels) similar to previous one except among the selected objects are choosen those with label (Th.sTh{i}.label) in labels array. By default, homogeneous Neumann boundary conditions are set on all boundaries.

2.5.2 Main methods

Let bvp be a BVP object.

setPDE function

```
bvp.setPDE(d,label,pde)
```

Description

 $\frac{\text{bvp.setPDE}(d, \text{label}, \text{pde})}{\text{If } i \text{ exists then bvp.pdes}\{i\} \text{ is set to pde}.}$ associated the pde object with the i-th submesh such that i=bvp.Th.find(d, label)

setDirichlet function

```
bvp.setDirichlet(label,g)
bvp.setDirichlet(label,g,Lm)
```

Description

bvp.setDirichlet(label,g) | for scalar B.V.P., sets Dirichlet boundary condition

$$u = g$$
, on Γ_{label}

and for vector B.V.P., sets Dirichlet boundary condition

$$u_i = g\{i\}, \forall i \in [1, m] \text{ on } \Gamma_{label}.$$

bvp.setDirichlet(label,g,Lm) for vector B.V.P., sets Dirichlet boundary condition

$$u_{\operatorname{Lm}(i)} = g\{i\}, \forall i \in [1, \operatorname{length}(\operatorname{Lm})] \text{ on } \Gamma_{\operatorname{label}}.$$

setRobin function

```
bvp.setRobin(label,gr,ar)
bvp.setRobin(label,gr,ar,Lm)
```

Description

bvp.setRobin(label,gr,ar) for scalar B.V.P., sets Robin boundary condition (1.4)

$$\frac{\partial u}{\partial n_{\mathcal{L}}} + \operatorname{ar} u = \operatorname{gr}, \text{ on } \Gamma_{\text{label}}.$$

For vector B.V.P., sets Robin boundary condition (1.16)

$$\frac{\partial \boldsymbol{u}}{\partial n_{\mathcal{H}_i}} + \operatorname{ar}\{i\}\boldsymbol{u}_i = \operatorname{gr}\{i\}, \quad \forall i \in [1, m] \text{ on } \Gamma_{\text{label}}.$$

bvp.setRobin(label,gr,ar,Lm) for vector B.V.P., sets Robin boundary condition (1.16): $\forall i \in [1, \text{length}(\text{Lm})], \text{ let } \alpha = \text{Lm}(i) \text{ then}$

$$\frac{\partial \pmb{u}}{\partial n_{\mathcal{H}_{\alpha}}} + \operatorname{ar}\{i\} \pmb{u}_{\alpha} = \operatorname{gr}\{i\}, \text{ on } \Gamma_{\mbox{label}}.$$

solve function

```
x=bvp.solve()
x=bvp.solve(key,value,...)
```

Description

x = bvp.solve()) uses P_1 -Lagrange finite elements method to solve the B.V.P. described by the bvp object.

x=bvp.solve(key,value,...)

- 'solver':
- 'split':
- 'local':

Chapter 3

Scalar boundary value problems

3.1 Poisson BVP's

The generic problem to solve is the following

Usual BVP 2: Poisson problem

Find $u \in H^1(\Omega)$ such that

$$-\Delta u = f \text{ in } \Omega \subset \mathbb{R}^{\dim}, \tag{3.1}$$

$$u = g_D \text{ on } \Gamma_D, \tag{3.2}$$

$$-\Delta u = f \text{ in } \Omega \subset \mathbb{R}^{\dim},$$

$$u = g_D \text{ on } \Gamma_D,$$

$$\frac{\partial u}{\partial n} + a_R u = g_R \text{ on } \Gamma_R,$$

$$(3.1)$$

where $\Omega \subset \mathbb{R}^{\dim}$ with $\partial \Omega = \Gamma_D \cup \Gamma_R$ and $\Gamma_D \cap \Gamma_R = \emptyset$.

The Laplacian operator Δ can be rewritten according to a \mathcal{L} operator defined in (1.1) and we have

$$-\Delta \stackrel{\mathsf{def}}{=} -\sum_{i=1}^{\dim} \frac{\partial^2}{\partial x_i^2} = \mathcal{L}_{\mathbb{I}, \mathbf{0}, \mathbf{0}, 0}. \tag{3.4}$$

The conormal derivative $\frac{\partial u}{\partial n_{\mathcal{L}}}$ of this \mathcal{L} operator is given by

$$\frac{\partial u}{\partial n_{\mathcal{L}}} \stackrel{\text{def}}{=} \langle \mathbb{A} \nabla u, \boldsymbol{n} \rangle - \langle \boldsymbol{b} u, \boldsymbol{n} \rangle = \frac{\partial u}{\partial n}. \tag{3.5}$$

We now will see how to implement different Poisson's BVP while using the FC-VFEM \mathbb{P}_1 toolbox.

3.1.1 2D Poisson BVP with Dirichlet boundary conditions on the unit square

Let Ω be the unit square with the associated mesh obtain from HyperCube function (see section ?? for explanation and Figure?? for a mesh sample) by the command

Th=fc simesh.HyperCube(2,50);

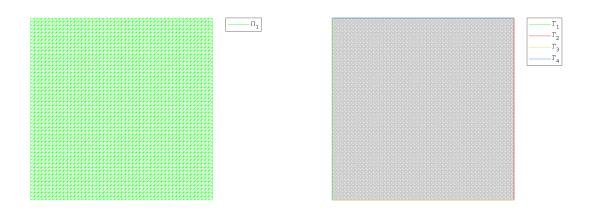

Figure 3.1: 2D hypercube (left) and its boundaries (right)

We choose the problem to have exact solution

$$u_{\rm ex}(x,y) = ??.$$

So we set $f = -\Delta u_{\text{ex}}$ i.e.

$$f(x,y) = ??.$$

On all the 4 boundaries we set a Dirichlet boundary conditions (and so $\Gamma_R = \emptyset$):

$$u = u_{\text{ex}}$$
, on $\Gamma_D = \Gamma_1 \cup \Gamma_2 \cup \Gamma_3 \cup \Gamma_4$.

So this problem can be written as the scalar BVP 5

Scalar BVP 3: 2D Poisson BVP with Dirichlet boundary conditions

Find $u \in H^1(\Omega)$ such that

$$\mathcal{L}_{\mathbf{0},\mathbf{0},\mathbf{0}}(u) = f \text{ in } \Omega = [0,1]^2,$$
 (3.6)

$$u = u_{\text{ex}} \text{ on } \Gamma_1 \cup \Gamma_2 \cup \Gamma_3 \cup \Gamma_4,$$
 (3.7)

In Listing 9, we give the complete code to solve this problem with FC-VFEM \mathbb{P}_1 toolbox.

In line?? we set the Dirichlet boundary conditions and in line?? we solve the BVP.

3.1.2 2D Poisson BVP with mixed boundary conditions

Let Ω be the unit square with the associated mesh obtain from HyperCube function (see section ?? for explanation and Figure ?? for a mesh sample)

We choose the problem to have exact solution

$$u_{\rm ex}(x,y) = ??.$$

So we set $f = -\Delta u_{\rm ex}$ i.e.

error (right)

$$f(x,y) = ??.$$

On boundary labels 1 and 2 we set a Dirichlet boundary conditions :

$$u = u_{\text{ex}}$$
, on $\Gamma^D = \Gamma_1 \cup \Gamma_2$.

On boundary label 3, we choose a Robin boundary condition with $a^{R}(x,y) = ??$. So we have

$$\frac{\partial u}{\partial n} + a^R u = g^R$$
, on $\Gamma^R = \Gamma_3$

with $q^R = ??$.

On boundary label 4, we choose a Newmann boundary condition. So we have

$$\frac{\partial u}{\partial n} = g^N$$
, on $\Gamma^N = \Gamma_4$

with $g^N = ??$. this can be also written in the form of a Robin condition with aR = 0So this problem can be written as the scalar BVP 5

Scalar BVP 4: 2D Poisson BVP with Dirichlet boundary conditions

Find $u \in H^1(\Omega)$ such that

$$\mathcal{L}_{\mathbf{0},\mathbf{0},\mathbf{0}}(u) = f \text{ in } \Omega = [0,1]^2,$$
 (3.8)

$$u = u_{\text{ex}} \text{ on } \Gamma_1 \cup \Gamma_2 \cup \Gamma_3 \cup \Gamma_4,$$
 (3.9)

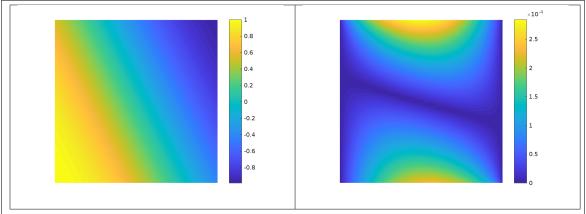

$$\frac{\partial u}{\partial n_{\mathcal{L}}} + a^{R}u = g^{R} \text{ on } \Gamma_{3},$$

$$\frac{\partial u}{\partial n_{\mathcal{L}}} = g^{N} \text{ on } \Gamma_{4},$$
(3.10)

$$\frac{\partial u}{\partial n_{c}} = g^{N} \text{ on } \Gamma_{4}, \tag{3.11}$$

(3.12)

In Listing 14, we give the complete code to solve this problem with FC-VFEM \mathbb{P}_1 toolbox.

```
uex = @(x,y) cos(2*x+y);
f = @(x,y) \ 5*cos(2*x+y);
gradu = { @(x,y) -2*sin(2*x+y), @(x,y) -sin(2*x+y) };
ar3 = @(x,y) 1+x.^2+y.^2;
Th=fc simesh.HyperCube(2,50);
Lop = Loperator(2,2,\{1,0;0,1\},[],[],[]);
pde=PDEelt(Lop,f);
bvp=BVP(Th,pde);
bvp.setDirichlet( 1, uex);
bvp.setDirichlet( 2, uex);
bvp.setRobin(3, @(x,y) - gradu{2}(x,y) + ar3(x,y).*uex(x,y),ar3);
bvp.setRobin( 4, gradu{2},[]);
U=bvp.solve();
```

Listing 3.2: Poisson 2D BVP with mixed boundary conditions: numerical solution (left) and error (right)

We set respectively in lines 11 and 12, the Robin and the Neumann boundary conditions by using SETROBIN member function of BVP class.

3.1.3 3D Poisson BVP with mixed boundary conditions

Let Ω be the unit cube with the associated mesh obtain from HyperCube function (see section ?? for explanation and Figure ?? for a mesh sample)

We choose the problem to have exact solution

$$u_{\rm ex}(x, y, y) = ??$$
.

So we set $f = -\Delta u_{\rm ex}$ i.e.

$$f(x, y, z) = ??$$
.

On boundary labels 1, 3, 5 we set a Dirichlet boundary conditions:

$$u = u_{\text{ex}}$$
, on $\Gamma^D = \Gamma_1 \cup \Gamma_3 \cup \Gamma_5$.

On boundary label 2, we choose a Robin boundary condition with $a^R(x,y) = ??$. So we have

$$\frac{\partial u}{\partial n} + a^R u = g^R$$
, on $\Gamma^R = \Gamma_2 \cup \Gamma_4$

with $g^R(x, y, z) = ??$, on Γ_2 and $g^R(x, y, z) = ??$, on Γ_4 .

On boundary label 6, we choose a Newmann boundary condition. So we have

$$\frac{\partial u}{\partial n} = g^N$$
, on $\Gamma^N = \Gamma_6$

with $g^N = ??$ this can be also written in the form of a Robin condition with aR = 0 on Γ_6 . So this problem can be written as the scalar BVP 5

Scalar BVP 5: 3D Poisson BVP with mixed boundary conditions

Find $u \in H^1(\Omega)$ such that

$$\mathcal{L}_{\mathbb{I},\mathbf{0},\mathbf{0},0}(u) = f \text{ in } \Omega = [0,1]^3,$$
 (3.13)

$$u = u_{\text{ex}} \text{ on } \Gamma_1 \cup \Gamma_3 \cup \Gamma_5, \tag{3.14}$$

$$\frac{\partial u}{\partial n_{\mathcal{L}}} + a^{R}u = g^{R} \text{ on } \Gamma_{2} \cup \Gamma_{4},$$

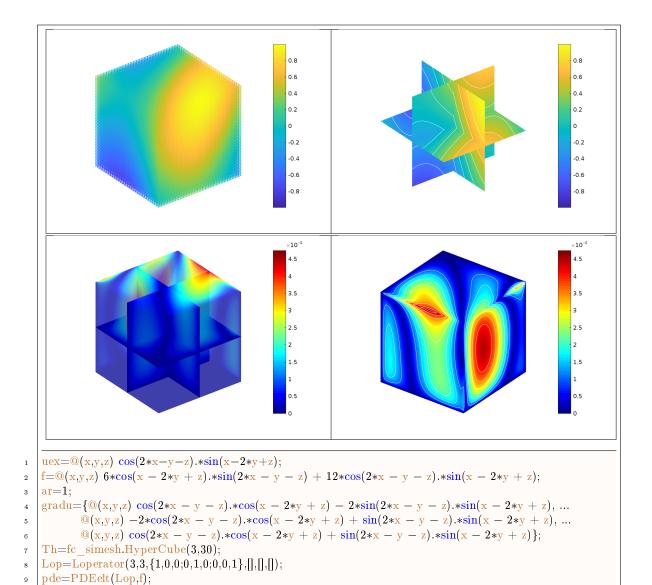

$$\frac{\partial u}{\partial n_{\mathcal{L}}} = g^{N} \text{ on } \Gamma_{6},$$
(3.15)

$$\frac{\partial u}{\partial r_6} = g^N \text{ on } \Gamma_6, \tag{3.16}$$

(3.17)

In Listing 16, we give the complete code to solve this problem with FC-VFEM \mathbb{P}_1 toolbox.

Poisson BVP's

Listing 3.3:~3D Poisson BVP with mixed boundary conditions: numerical solution (upper) and error (bottom)

3.1.4 1D BVP : just for fun

for lab=[1,3,5], bvp.setDirichlet(lab, uex);end

 $bvp.setRobin(6,@(x,y,z) gradu{3}(x,y,z),[]);$

 $bvp.setRobin(2,@(x,y,z)\ gradu\{1\}(x,y,z)+ar*uex(x,y,z),ar);\\bvp.setRobin(4,@(x,y,z)\ gradu\{2\}(x,y,z)+ar*uex(x,y,z),ar);\\$

bvp = BVP(Th, pde);

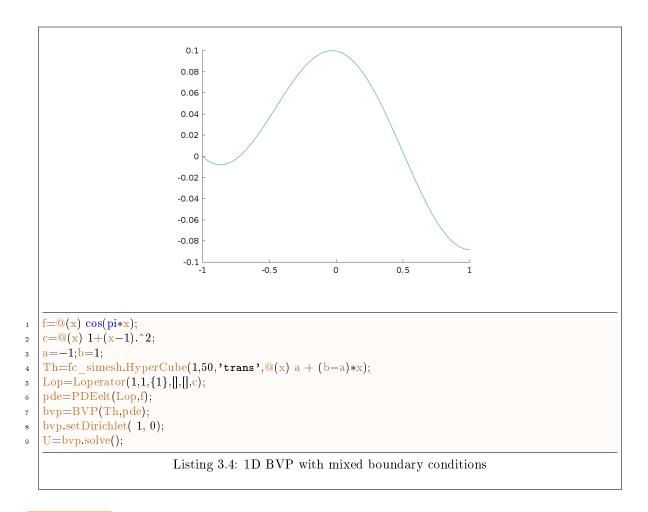

U=bvp.solve();

14

Let Ω be the interval [a,b] we want to solve the following PDE

$$-u''(x) + c(x)u(x) = f(x) \quad \forall x \in]a, b[$$

with the Dirichlet boundary condition u(a) = 0 and the homgeneous Neumann boundary condition on b

3.2 Stationary convection-diffusion problem

3.2.1 Stationary convection-diffusion problem in 2D

The 2D problem to solve is the following

Find $u \in H^1(\Omega)$ such that

$$-\operatorname{div}(\alpha \nabla u) + \langle \boldsymbol{V}, \nabla u \rangle + \beta u = f \text{ in } \Omega \subset \mathbb{R}^2,$$
(3.18)

$$u = 4 \text{ on } \Gamma_2, \tag{3.19}$$

$$u = -4 \text{ on } \Gamma_4, \tag{3.20}$$

$$u = 0 \text{ on } \Gamma_{20} \cup \Gamma_{21}, \tag{3.21}$$

$$\frac{\partial u}{\partial n} = 0 \text{ on } \Gamma_1 \cup \Gamma_3 \cup \Gamma_{10} \tag{3.22}$$

where Ω and its boundaries are given in Figure ??. This problem is well posed if $\alpha(\boldsymbol{x}) > 0$ and $\beta(\boldsymbol{x}) \geq 0$.

We choose α , \boldsymbol{V} , β and f in Ω as:

$$\alpha(\mathbf{x}) = 0.1 + (x_1 - 0.5)^2,$$
 $\mathbf{V}(\mathbf{x}) = (-10x_2, 10x_1)^t,$
 $\beta(\mathbf{x}) = 0.01,$
 $f(\mathbf{x}) = -200 \exp(-10((x_1 - 0.75)^2 + x_2^2)).$

Figure 3.2: 2D stationary convection-diffusion BVP: mesh (left) and boundaries (right)

The problem (3.18)-(3.22) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

Scalar BVP 6: 2D stationary convection-diffusion problem

Find $u \in H^1(\Omega)$ such that

$$\mathcal{L}(u) = f$$
 in Ω ,
 $u = g^D$ on Γ^D ,
 $\frac{\partial u}{\partial n_{\mathcal{L}}} + a^R u = g^R$ on Γ^R .

where

• $\mathcal{L} := \mathcal{L}_{\alpha \mathbb{I}, \mathbf{0}, \mathbf{V}, \beta}$, and then the conormal derivative of u is given by

$$\frac{\partial u}{\partial n_{\mathcal{L}}} := \left\langle \mathbb{A} \nabla u, \boldsymbol{n} \right\rangle - \left\langle \boldsymbol{b} u, \boldsymbol{n} \right\rangle = \alpha \frac{\partial u}{\partial n}.$$

- $\Gamma^D = \Gamma_2 \cup \Gamma_4 \cup \Gamma_{20} \cup \Gamma_{21}$ and $\Gamma^R = \Gamma_1 \cup \Gamma_3 \cup \Gamma_{10}$
- $g^D := 4$ on Γ_2 , and $g^D := -4$ on Γ_4 and $g^D := 0$ on $\Gamma_{20} \cup \Gamma_{21}$
- $a^R = g^R := 0$ on Γ^R .

The algorithm using the toolbox for solving (3.18)-(3.22) is the following:

Algorithm 1 Stationary convection-diffusion problem in 2D

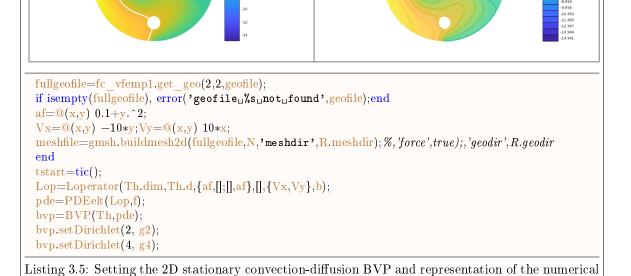

```
1: \mathcal{T}_h \leftarrow \text{siMesh}(...)
                                                                                                                                                   ⊳ Get mesh

```

The numerical solution for a given mesh is shown on figures of Listing ??

3.2.2 Stationary convection-diffusion problem in 3D

Let $A = (x_A, y_A) \in \mathbb{R}^2$ and $\mathcal{C}_A^r([z_{min}, z_{max}])$ be the right circular cylinder along z-axis $(z \in [z_{min}, z_{max}])$ with bases the circles of radius r and center (x_A, y_A, z_{min}) and (x_A, y_A, z_{max}) .

Let Ω be the cylinder defined by

solution

$$\Omega = \mathcal{C}^1_{(0,0)}([0,3]) \setminus \{\mathcal{C}^{0.3}_{(0,0)}([0,3]) \cup \mathcal{C}^{0.1}_{(0,-0.7)}([0,3]) \cup \mathcal{C}^{0.1}_{(0,0.7)}([0,3])\}.$$

We respectively denote by Γ_{1000} and Γ_{1001} the z=0 and z=3 bases of Ω .

 Γ_1 , Γ_{10} , Γ_{20} and Γ_{21} are respectively the curved surfaces of cylinders $\mathcal{C}^1_{(0,0)}([0,3])$, $\mathcal{C}^{0.3}_{(0,0)}([0,3])$, $\mathcal{C}^{0.1}_{(0,-0.7)}([0,3])$ and $\mathcal{C}^{0.1}_{(0,0.7)}([0,3])$. The domain Ω and its boundaries are represented in Figure $\ref{eq:condition}$.

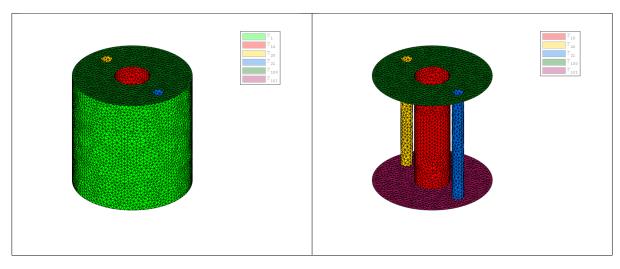

Figure 3.3: 3D stationary convection-diffusion BVP: all boundaries (left) and boundaries without Γ_1 (right)

The 3D problem to solve is the following

- Usual BVP 4:

3D problem: Stationary convection-diffusion Find $u \in H^2(\Omega)$ such that

$$-\operatorname{div}(\alpha \nabla u) + \langle \boldsymbol{V}, \nabla u \rangle + \beta u = f \text{ in } \Omega \subset \mathbb{R}^3,$$
(3.23)

$$\alpha \frac{\partial u}{\partial n} + a_{20}u = g_{20} \text{ on } \Gamma_{20},$$
 (3.24)

$$\alpha \frac{\partial u}{\partial n} + a_{21}u = g_{21} \text{ on } \Gamma_{21},$$

$$\alpha \frac{\partial u}{\partial n} + a_{21}u = g_{21} \text{ on } \Gamma_{21},$$

$$\frac{\partial u}{\partial n} = 0 \text{ on } \Gamma^{N}$$
(3.25)

$$\frac{\partial u}{\partial n} = 0 \text{ on } \Gamma^N \tag{3.26}$$

where $\Gamma^N = \Gamma_1 \cup \Gamma_{100} \cup \Gamma_{1000} \cup \Gamma_{1001}$. This problem is well posed if $\alpha(\boldsymbol{x}) > 0$ and $\beta(\boldsymbol{x}) \ge 0$. We choose $a_{20} = a_{21} = 1$, $g_{21} = -g_{20} = 0.05 \ \beta = 0.01$ and :

$$\alpha(\mathbf{x}) = 0.7 + \mathbf{x}_3/10,$$

 $\mathbf{V}(\mathbf{x}) = (-10x_2, 10x_1, 10x_3)^t,$

$$f(\mathbf{x}) = -800 \exp(-10((x_1 - 0.65)^2 + x_2^2 + (x_3 - 0.5)^2)) +800 \exp(-10((x_1 + 0.65)^2 + x_2^2 + (x_3 - 0.5)^2)).$$

The problem (3.23)-(3.26) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

$Scalar \; \mathrm{BVP} \; 7:$

3D stationary convection-diffusion problem as a scalar BVP Find $u \in H^2(\Omega)$ such that

$$\mathcal{L}(u) = f$$
 in Ω ,
 $\frac{\partial u}{\partial n_{\mathcal{L}}} + a^R u = g^R$ on Γ^R .

where

• $\mathcal{L}:=\mathcal{L}_{\alpha\mathbb{I},\mathbf{0},\boldsymbol{V},\beta},$ and then the conormal derivative of u is given by

$$\frac{\partial u}{\partial n_{\mathcal{L}}} := \langle \mathbb{A} \nabla u, \boldsymbol{n} \rangle - \langle \boldsymbol{b} u, \boldsymbol{n} \rangle = \alpha \frac{\partial u}{\partial n}.$$

• $\Gamma^R = \Gamma_1 \cup \Gamma_{10} \cup \Gamma_{20} \cup \Gamma_{21} \cup \Gamma_{1000} \cup \Gamma_{1001}$ (and $\Gamma^D = \emptyset$)

$$a^{R} = \begin{cases} 0 & \text{on } \Gamma_{1} \cup \Gamma_{10} \cup \Gamma_{1000} \cup \Gamma_{1001} \\ 1 & \text{on } \Gamma_{20} \cup \Gamma_{21} \end{cases}$$
$$g^{R} = \begin{cases} 0 & \text{on } \Gamma_{1} \cup \Gamma_{10} \cup \Gamma_{1000} \cup \Gamma_{1001} \\ 0.05 & \text{on } \Gamma_{21}, \\ -0.05 & \text{on } \Gamma_{20} \end{cases}$$

We give respectively in Listing 11 the corresponding Matlab codes and the numerical solution for a more refined mesh.

Listing 3.6: Setting the 3D stationary convection-diffusion BVP and representation of the numerical solution

3.3 2D electrostatic BVPs

In this sample, we shall discuss electrostatic solutions for current flow in resistive media. Consider a region Ω of contiguous solid and/or liquid conductors. Let \boldsymbol{j} be the current density in A/m^2 . It's satisfy

$$\operatorname{div} \mathbf{j} = 0, \quad \text{in } \Omega. \tag{3.27}$$

$$\mathbf{j} = \sigma \mathbf{E}, \quad \text{in } \Omega. \tag{3.28}$$

where σ is the local electrical conductivity and E the local electric field.

The electric field can be written as a gradient of a scalar potential

$$\boldsymbol{E} = -\boldsymbol{\nabla}\,\varphi, \quad \text{in } \Omega. \tag{3.29}$$

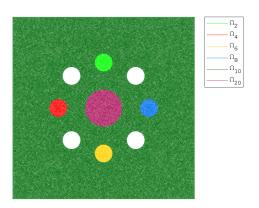

Combining all these equations leads to Laplace's equation

$$\operatorname{div}(\sigma \nabla \varphi) = 0 \tag{3.30}$$

In the resistive model, a good conductor has high value of σ and a good insulator has $0 < \sigma \mu 1$.

in the resistive induct, a good conductor has ingh value of a and a good insulate							
Material	$\rho(\Omega.m)$ at $20^{\circ}C$	$\sigma(S/m)$ at $20^{\circ}C$					
Carbon (graphene)	1.00×10^{-8}	1.00×10^{8}					
Gold	2.44×10^{-8}	4.10×10^{8}					
	$2.00 \times 10^{1} \text{ to } 2.00 \times 10^{3}$	$5.00 \times 10^{-4} \text{ to } 5.00 \times 10^{-2}$					
	6.40×10^2	1.56×10^{-3}					
Glass	$1.00 \times 10^{11} \text{ to } 1.00 \times 10^{15}$	10^{-15} to 10^{-11}					
Air	$1.30 \times 10^{16} \text{ to } 3.30 \times 10^{16}$	3×10^{-15} to 8×10^{-15}					

As example, we use the mesh obtain with gmsh from square4holes6dom.geo file represented in Figure 3.4

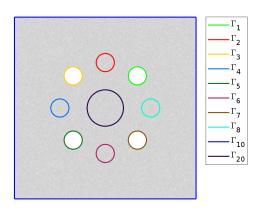

Figure 3.4: Mesh from square4holes6dom.geo, domains representation (left) and boundaries (right)

We have two resistive medias

$$\Omega_a = \Omega_{10}$$
 and $\Omega_b = \Omega_{20} \cup \Omega_2 \cup \Omega_4 \cup \Omega_6 \cup \Omega_8$.

In Ω_a and Ω_b the local electrical conductivity are respectively given by

$$\sigma = \begin{cases} \sigma_a &= 10^4, & \text{in } \Omega_a \\ \sigma_b &= 10^{-4} & \text{in } \Omega_a \end{cases}$$

We solve the following BVP

- Usual BVP 5: 2D electrostatic problem

Find $\varphi \in H^1(\Omega)$ such that

$$\operatorname{div}(\sigma \nabla \varphi) = 0 \qquad \qquad \text{in } \Omega, \qquad (3.31)$$

$$\varphi = 0 \qquad \qquad \text{on } \Gamma_3 \cup \Gamma_7, \qquad (3.32)$$

$$\varphi = 12 \qquad \qquad \text{on } \Gamma_1 \cup \Gamma_5, \qquad (3.33)$$

$$\partial \varphi$$

$$\sigma \frac{\partial \varphi}{\partial n} = 0 \qquad \text{on } \Gamma_{10}. \tag{3.34}$$

The problem (3.31)-(3.34) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

$\cline{Q}Scalar$ BVP 8 : 2D electrostatic problem

Find $\varphi \in H^1(\Omega)$ such that

$$\mathcal{L}(\varphi) = 0$$
 in Ω ,
 $\varphi = g^D$ on Γ^D ,
 $\frac{\partial \varphi}{\partial n_{\mathcal{L}}} + a^R \varphi = g^R$ on Γ^R .

where

• $\mathcal{L} := \mathcal{L}_{\sigma \mathbb{I}, \mathbf{0}, \mathbf{V}, \beta}$, and then the conormal derivative of φ is given by

$$\frac{\partial \varphi}{\partial n_{\mathcal{L}}} := \left\langle \mathbb{A} \, \pmb{\nabla} \, \varphi, \pmb{n} \right\rangle - \left\langle \pmb{b} \varphi, \pmb{n} \right\rangle = \sigma \frac{\partial \varphi}{\partial n}.$$

- $\Gamma^D = \Gamma_1 \cup \Gamma_3 \cup \Gamma_5 \cup \Gamma_7$ and $\Gamma^R = \Gamma_{10}$. The other borders should not be used to specify boundary conditions: they do not intervene in the variational formulation and in the physical problem!
- $g^D := 0$ on $\Gamma_3 \cup \Gamma_7$, and $g^D := 12$ on $\Gamma_1 \cup \Gamma_5$.
- $a^R = g^R := 0$ on Γ^R .

3.3.2D electrostatic BVPs

To write this problem properly with FC-VFEM \mathbb{P}_1 toolbox, we split (3.31) in two parts

$$\operatorname{div}(\sigma_a \nabla \varphi) = 0 \qquad \text{in } \Omega_a$$

$$\operatorname{div}(\sigma_b \nabla \varphi) = 0 \qquad \text{in } \Omega_b$$

and we set these PDEs on each domains. This is done in Matlab Listing 3.7.

Listing 3.7: Setting the 2D electrostatic BVP, Matlab code

```
tstart=tic();
end
tstart=tic();
Lop=Loperator(dim,d,{sigma2,0;0,sigma2},[],[],[]);
pde=PDEelt(Lop);
bvp=BVP(Th,pde);
Lop=Loperator(dim,d,{sigma1,0;0,sigma1},[],[],[]);
pde=PDEelt(Lop);
bvp.setPDE(2,10,pde);
bvp.setDirichlet(1, 12);
bvp.setDirichlet(3, 0);
```

We show in Figures 3.5 and 3.6 respectively the potential φ and the norm of the electric field E.

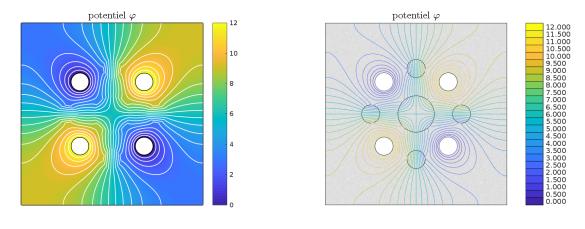

Figure 3.5: Test 1, potential φ

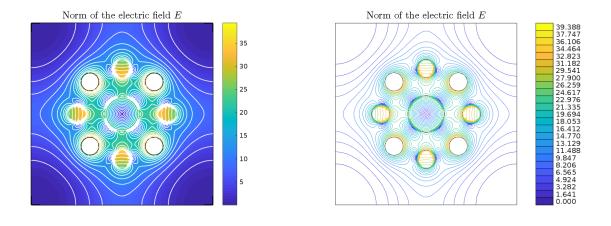

Figure 3.6: Test 1, norm of the electrical field \boldsymbol{E}

Vector boundary value problems

4.1 Elasticity problem

General case (d=2,3)4.1.1

We consider here Hooke's law in linear elasticity, under small strain hypothesis (see for example [3]). For a sufficiently regular vector field $\mathbf{u} = (u_1, \dots, u_d) : \Omega \to \mathbb{R}^d$, we define the linearized strain tensor $\underline{\epsilon}$ by

$$\underline{\boldsymbol{\epsilon}}(\boldsymbol{u}) = \frac{1}{2} \left(\boldsymbol{\nabla}(\boldsymbol{u}) + \boldsymbol{\nabla}^t(\boldsymbol{u}) \right).$$

We set $\underline{\boldsymbol{\epsilon}} = (\epsilon_{11}, \epsilon_{22}, 2\epsilon_{12})^t$ in 2d and $\underline{\boldsymbol{\epsilon}} = (\epsilon_{11}, \epsilon_{22}, \epsilon_{33}, 2\epsilon_{12}, 2\epsilon_{23}, 2\epsilon_{13})^t$ in 3d, with $\epsilon_{ij}(\boldsymbol{u}) = \frac{1}{2} \left(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right)$. Then the Hooke's law writes

$$\sigma = \mathbb{C}\epsilon$$
,

where $\underline{\boldsymbol{\sigma}}$ is the elastic stress tensor and $\mathbb C$ the elasticity tensor.

The material is supposed to be isotropic. Thus the elasticity tensor $\mathbb C$ is only defined by the Lamé parameters λ and μ , which satisfy $\lambda + \mu > 0$. We also set $\gamma = 2\mu + \lambda$. For d = 2 or d = 3, \mathbb{C} is given by

$$\mathbb{C} = \begin{pmatrix} \lambda \mathbb{1}_2 + 2\mu \mathbb{I}_2 & 0 \\ 0 & \mu \end{pmatrix}_{3\times 3} \quad \text{or} \quad \mathbb{C} = \begin{pmatrix} \lambda \mathbb{1}_3 + 2\mu \mathbb{I}_3 & 0 \\ 0 & \mu \mathbb{I}_3 \end{pmatrix}_{6\times 6},$$

respectively, where $\mathbb{1}_d$ is a d-by-d matrix of ones, and \mathbb{I}_d the d-by-d identity matrix.

For dimension d = 2 or d = 3, we have:

$$\boldsymbol{\sigma}_{\alpha\beta}(\boldsymbol{u}) = 2 \mu \boldsymbol{\epsilon}_{\alpha\beta}(\boldsymbol{u}) + \lambda \operatorname{tr}(\boldsymbol{\epsilon}(\boldsymbol{u})) \delta_{\alpha\beta} \ \forall \alpha, \beta \in [\![1,d]\!]$$

The problem to solve is the following

$\widetilde{\phi}^{-}Usual$ vector BVP 2: Elasticity problem

Find $\mathbf{u} = \mathrm{H}^2(\Omega)^d$ such that

$$-\operatorname{div}(\boldsymbol{\sigma}(\boldsymbol{u})) = \boldsymbol{f}, \text{ in } \Omega \subset \mathbb{R}^d,$$

$$\boldsymbol{\sigma}(\boldsymbol{u}).\boldsymbol{n} = \boldsymbol{0} \text{ on } \Gamma^R,$$

$$(4.1)$$

$$\boldsymbol{\sigma}(\boldsymbol{u}).\boldsymbol{n} = \boldsymbol{0} \text{ on } \Gamma^R, \tag{4.2}$$

$$\mathbf{u} = \mathbf{0} \text{ on } \Gamma^D. \tag{4.3}$$

Now, with the following lemma, we obtain that this problem can be rewritten as the vector BVP

Elasticity problem 28

defined by (1.14) to (1.16).

Lemme 4.1

Let \mathcal{H} be the d-by-d matrix of the second order linear differential operators defined in (1.10) where $\mathcal{H}_{\alpha,\beta} = \mathcal{L}_{\mathbb{A}^{\alpha,\beta},\mathbf{0},\mathbf{0},0}, \forall (\alpha,\beta) \in [1,d]^2$, with

$$(\mathbb{A}^{\alpha,\beta})_{k,l} = \mu \delta_{\alpha\beta} \delta_{kl} + \mu \delta_{k\beta} \delta_{l\alpha} + \lambda \delta_{k\alpha} \delta_{l\beta}, \ \forall (k,l) \in [1,d]^2.$$

$$(4.4)$$

then

$$\mathcal{H}(\boldsymbol{u}) = -\operatorname{div}\boldsymbol{\sigma}(\boldsymbol{u}) \tag{4.5}$$

and, $\forall \alpha \in [1, d]$,

$$\frac{\partial \mathbf{u}}{\partial n_{\mathcal{H}_{\alpha}}} = (\boldsymbol{\sigma}(\mathbf{u}).\boldsymbol{n})_{\alpha}. \tag{4.6}$$

The proof is given in appendix ??. So we obtain

Vector BVP 3: Elasticity problem with \mathcal{H} operator in dimension d=2or d=3

Let \mathcal{H} be the d-by-d matrix of the second order linear differential operators defined in (1.10) where $\forall (\alpha, \beta) \in [1, d]^2, \mathcal{H}_{\alpha, \beta} = \mathcal{L}_{\mathbb{A}^{\alpha, \beta}, \mathbf{0}, \mathbf{0}}, \text{ with }$

$$\bullet \text{ for } d = 2, \\ \mathbb{A}^{1,1} = \begin{pmatrix} \gamma & 0 \\ 0 & \mu \end{pmatrix}, \ \mathbb{A}^{1,2} = \begin{pmatrix} 0 & \lambda \\ \mu & 0 \end{pmatrix}, \ \mathbb{A}^{2,1} = \begin{pmatrix} 0 & \mu \\ \lambda & 0 \end{pmatrix}, \ \mathbb{A}^{2,2} = \begin{pmatrix} \mu & 0 \\ 0 & \gamma \end{pmatrix}$$

 $\mathbb{A}^{1,1} = \begin{pmatrix} \gamma & 0 & 0 \\ 0 & \mu & 0 \\ 0 & 0 & \mu \end{pmatrix}, \quad \mathbb{A}^{1,2} = \begin{pmatrix} 0 & \lambda & 0 \\ \mu & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \mathbb{A}^{1,3} = \begin{pmatrix} 0 & 0 & \lambda \\ 0 & 0 & 0 \\ \mu & 0 & 0 \\ \mu & 0 & 0 \end{pmatrix}$ $\mathbb{A}^{2,1} = \begin{pmatrix} 0 & \mu & 0 \\ \lambda & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \mathbb{A}^{2,2} = \begin{pmatrix} \mu & 0 & 0 \\ 0 & \gamma & 0 \\ 0 & 0 & \mu \end{pmatrix}, \quad \mathbb{A}^{2,3} = \begin{pmatrix} 0 & 0 & \lambda \\ 0 & 0 & 0 \\ 0 & 0 & \lambda \\ 0 & \mu & 0 \end{pmatrix},$ $\mathbb{A}^{3,1} = \begin{pmatrix} 0 & 0 & \mu \\ 0 & 0 & 0 \\ \lambda & 0 & 0 \end{pmatrix}, \quad \mathbb{A}^{3,2} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & \mu \\ 0 & \lambda & 0 \end{pmatrix}, \quad \mathbb{A}^{3,3} = \begin{pmatrix} \mu & 0 & 0 \\ 0 & \mu & 0 \\ 0 & 0 & \gamma \end{pmatrix}.$

The elasticity problem (4.1) to (4.3) can be rewritten as:

Find $\boldsymbol{u} = (\boldsymbol{u}_1, \dots, \boldsymbol{u}_d) \in (\mathrm{H}^2(\Omega))^d$ such that

$$\mathcal{H}(\boldsymbol{u}) = \boldsymbol{f}, \qquad \text{in } \Omega, \tag{4.7}$$

$$\frac{\partial \boldsymbol{u}}{\partial n_{\mathcal{H}_{\alpha}}} = 0, \qquad \text{on } \Gamma_{\alpha}^{R} = \Gamma^{R}, \ \forall \alpha \in [1, d]$$
(4.8)

$$\mathbf{u}_{\alpha} = 0,$$
 on $\Gamma_{\alpha}^{D} = \Gamma^{D}, \ \forall \alpha \in [1, d].$ (4.9)

2D example 4.1.2

For example, in 2d, we want to solve the elasticity problem (4.1) to (4.3) where Ω and its boundaries are given in Figure 4.1.

The material's properties are given by Young's modulus E and Poisson's coefficient ν . As we use plane strain hypothesis, Lame's coefficients verify

$$\mu = \frac{E}{2(1+\nu)}, \quad \lambda = \frac{E\nu}{(1+\nu)(1-2\nu)}, \quad \gamma = 2\mu + \lambda$$

The material is rubber so that $E=21.10^5 \, \mathrm{Pa}$ and $\nu=0.45$. We also have $\boldsymbol{f}=\boldsymbol{x}\mapsto (0,-1)^t$ and we choose $\Gamma^R = \Gamma^1 \cup \Gamma^2 \cup \Gamma^3$, $\Gamma^D = \Gamma^4$.

We give in Listing 4.1 the corresponding Matlab codes.

Elasticity problem 29

Figure 4.1: Domain and boundaries

Listing 4.1: 2D elasticity, Matlab code

```
fprintf('1. _{\sqcup}Building_{\sqcup}the_{\sqcup}mesh_{\sqcup}using_{\sqcup}HyperCube_{\sqcup}function');\\ \%Hop=Hoperator.StiffElas(dim,lam,mu);\\ gamma=lambda+2*mu;\\ Hop=Hoperator(dim,dim,dim);\\ Hop.set(1,1,Loperator(dim,dim,\{gamma,[];[],mu\},[],[],[]));\\ Hop.set(1,2,Loperator(dim,dim,\{[],lambda;mu,[]\},[],[],[]));\\ Hop.set(2,1,Loperator(dim,dim,\{[],mu;lambda,[]\},[],[],[]));\\ Hop.set(2,2,Loperator(dim,dim,\{mu,[];[],gamma\},[],[],[]));\\ pde=PDEelt(Hop,\{0,-1\});\\ bvp=BVP(Th,pde);\\ fprintf('2.b_{\sqcup}Solving_{\sqcup}2D_{\sqcup}elasticity_{\sqcup}BVP'n')
```

One can also use the Matlab function HOPERATOR. STIFFELAS to build the elasticity operator:

```
Hop=Hoperator.StiffElas(dim,lambda,mu);
```

For a given mesh, its displacement scaled by a factor 50 is shown on Figure 4.2

Figure 4.2: Mesh displacement scaled by a factor 50 for the 2D elasticity problem

Elasticity problem 30

4.1.3 3D example

Let $\Omega = [0,5] \times [0,1] \times [0,1] \subset \mathbb{R}^3$. The boundary of Ω is made of six faces and each one has a unique label: 1 to 6 respectively for faces $x_1 = 0$, $x_1 = 5$, $x_2 = 0$, $x_2 = 1$, $x_3 = 0$ and $x_3 = 1$. We represent them in Figure 4.3.

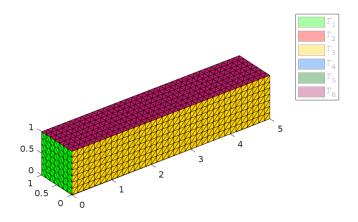

Figure 4.3: Domain and boundaries

We want to solve the elasticity problem (4.1) to (4.3) with $\Gamma^D = \Gamma_1$, $\Gamma^N = \bigcup_{i=2}^6 \Gamma_i$ and $\boldsymbol{f} = \boldsymbol{x} \mapsto (0,0,-1)^t$.

We give in Listing 4.2 the corresponding Matlab code using function HOPERATOR.STIFFELAS.

Listing 4.2: **3D** elasticity, Matlab code

```
\begin{split} & \textbf{fprintf('1.} \sqcup \textbf{Building} \sqcup \textbf{the} \sqcup \textbf{mesh} \sqcup \textbf{using} \sqcup \textbf{HyperCube} \sqcup \textbf{function'n'}); \\ & \textbf{fprintf('2.} \sqcup \textbf{a} \sqcup \textbf{Setting} \sqcup \textbf{3D} \sqcup \textbf{elasticity} \sqcup \textbf{BVP'n'}); \\ & \textbf{Hop} = \textbf{Hoperator()}; \\ & \textbf{Hop.opStiffElas(dim,lambda,mu)}; \\ & \textbf{pde} = \textbf{PDEelt(Hop,\{0,0,-1\})}; \\ & \textbf{bvp.setDirichlet(1,0.,1:3)}; \end{split}
```

The displacement scaled by a factor 2000 for a given mesh is shown on Figure 4.4.

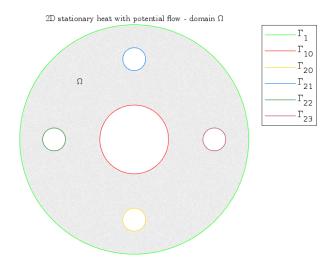

Figure 4.5: Domain and boundaries

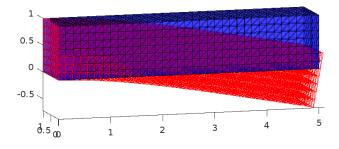

Figure 4.4: Result for the 3D elasticity problem

4.2 Stationary heat with potential flow in 2D

Let Γ_1 be the unit circle, Γ_{10} be the circle with center point (0,0) and radius 0.3. Let Γ_{20} , Γ_{21} , Γ_{22} and Γ_{23} be the circles with radius 0.1 and respectively with center point (0,-0.7), (0,0.7), (-0.7,0) and (0.7,0). The domain $\Omega \subset \mathbb{R}^2$ is defined as the inner of Γ_1 and the outer of all other circles (see Figure 4.5). The 2D problem to solve is the following

6- Usual BVP 6: 2D problem: stationary heat with potential flow

Find $u \in H^2(\Omega)$ such that

$$-\operatorname{div}(\alpha \nabla u) + \langle V, \nabla u \rangle + \beta u = 0 \text{ in } \Omega \subset \mathbb{R}^2, \tag{4.10}$$

$$u = 20 * \boldsymbol{x}_2 \text{ on } \Gamma_{21}, \tag{4.11}$$

$$u = 0 \text{ on } \Gamma_{22} \cup \Gamma_{23}, \tag{4.12}$$

$$\frac{\partial u}{\partial n} = 0 \text{ on } \Gamma_1 \cup \Gamma_{10} \cup \Gamma_{20} \tag{4.13}$$

where Ω and its boundaries are given in Figure 4.5. This problem is well posed if $\alpha(\boldsymbol{x}) > 0$ and

We choose α and β in Ω as :

$$\alpha(\mathbf{x}) = 0.1 + \mathbf{x}_2^2,$$

$$\beta(\mathbf{x}) = 0.01$$

The potential flow is the velocity field $V = \nabla \phi$ where the scalar function ϕ is the velocity potential solution of the 2D BVP (4.14)-(4.17)

- Usual BVP 7: 2D velocity potential BVP

Find $\phi \in H^2(\Omega)$ such that

$$-\Delta \phi = 0 \text{ in } \Omega, \tag{4.14}$$

$$\phi = -20 \text{ on } \Gamma_{21}, \tag{4.15}$$

$$\phi = 20 \text{ on } \Gamma_{20}, \tag{4.16}$$

$$\frac{\partial \phi}{\partial n} = 0 \text{ on } \Gamma_1 \cup \Gamma_{23} \cup \Gamma_{22} \tag{4.17}$$

Then the potential flow V is solution of (4.18)

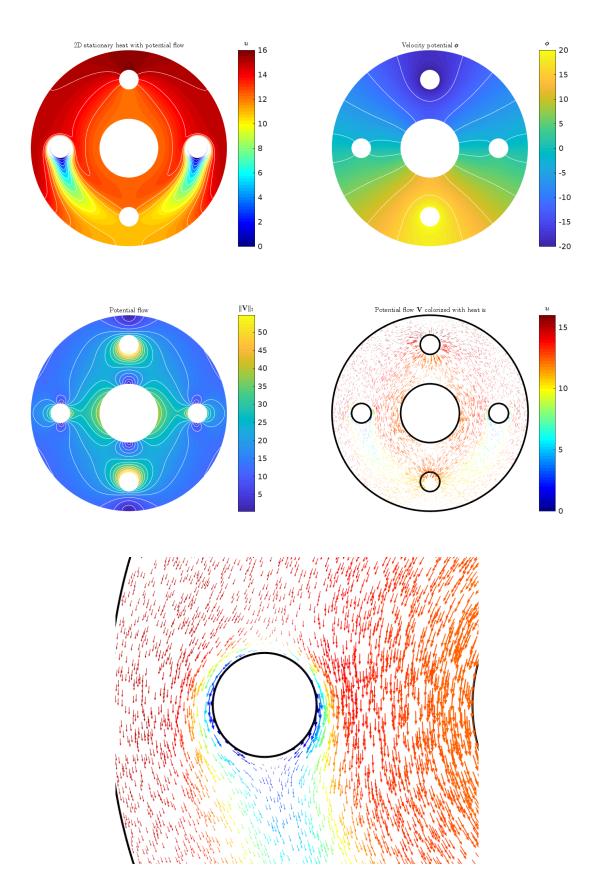

$\bigcirc Usual$ vector BVP 3 : 2D potential flow

Find $\boldsymbol{V} = (\boldsymbol{V}_1, \boldsymbol{V}_2) \in \mathrm{H}^1(\Omega) \times \mathrm{H}^1(\Omega)$ such that

$$V = \nabla \phi \text{ in } \Omega,$$
 (4.18)

For a given mesh, the numerical result for heat u is represented in Figure ??, velocity potential ϕ and potential flow V are shown on Figure ??.

Now we will present two manners of solving these problems using FC-VFEM \mathbb{P}_1 codes.

4.2.1 Method 1 : split in three parts

The 2D potential velocity problem (4.14)-(4.17) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

$\int Scalar \text{ BVP 9}$: 2D potential velocity

Find $\phi \in H^2(\Omega)$ such that

$$\mathcal{L}(\phi) = f \qquad \text{in } \Omega,$$

$$\phi = g^{D} \qquad \text{on } \Gamma^{D},$$

$$\frac{\partial \phi}{\partial n_{\mathcal{L}}} + a^{R} \phi = g^{R} \qquad \text{on } \Gamma^{R}.$$

where

• $\mathcal{L} := \mathcal{L}_{\mathbb{I},\mathbf{0},\mathbf{0},0}$, and then the conormal derivative of ϕ is given by

$$\frac{\partial \phi}{\partial n_{\mathcal{L}}} := \langle \mathbb{A} \nabla \phi, \boldsymbol{n} \rangle - \langle \boldsymbol{b} \phi, \boldsymbol{n} \rangle = \frac{\partial \phi}{\partial n}.$$

- f(x) := 0
- $\Gamma^D = \Gamma_{20} \cup \Gamma_{21}$
- $\Gamma^R = \Gamma_1 \cup \Gamma_{23} \cup \Gamma_{22}$
- $g^D := 20$ on Γ_{20} , and $g^D := -20$ on Γ_{21}
- $q^R = a^R := 0$ on Γ^R . (Neumann boundary condition)

The code using the toolbox for solving (4.14)-(4.17) is given in Listing 4.6.

Listing 4.3: Stationary heat with potential flow in 2D, Matlab code (method 1)

```
 \begin{array}{l} d{=}2;\\ Lop{=}Loperator(d,d,\{1,[];[],1\},[],[],[]);\\ bvpPotential{=}BVP(Th,PDEelt(Lop));\\ bvpPotential.setDirichlet(20,20);\\ bvpPotential.setDirichlet(21,-20);\\ phi{=}bvpPotential.solve(); \end{array}
```

Now to compute V, we can write the potential flow problem (4.18) with \mathcal{H} -operators as

$$V = \begin{pmatrix} V_1 \\ V_2 \end{pmatrix} = \mathcal{B} \begin{pmatrix} \phi \\ \phi \end{pmatrix}$$

where

$$\mathcal{B} = \begin{pmatrix} \mathcal{L}_{\mathbb{O}_2, \mathbf{0}_2, (1,0)^t, 1} & 0 \\ 0 & \mathcal{L}_{\mathbb{O}_2, \mathbf{0}_2, (0,1)^t, 0} \end{pmatrix}$$

The code using the toolbox for solving this problem is given in Listing 4.6.

Listing 4.4: Stationary heat with potential flow in 2D, Matlab code (method 1)

```
\begin{aligned} & \text{Hop=Hoperator}(\text{Th.dim,d,d}); \\ & \text{Hop.H}\{1,1\} = & \text{Loperator}(\text{d,d,||,||,}\{1,0\},||); \\ & \text{Hop.H}\{2,2\} = & \text{Loperator}(\text{d,d,||,||,}\{0,1\},||); \\ & \text{V=Hop.apply}(\text{Th,}\{\text{phi,phi}\}); \end{aligned}
```

Obviously, one can compute separately V_1 and V_2 .

Finally, the stationary heat BVP (4.10)-(4.13) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

© Usual BVP 8 : 2D stationary heat

Find $u \in H^2(\Omega)$ such that

$$\mathcal{L}(u) = f \qquad \text{in } \Omega,$$

$$u = g^{D} \qquad \text{on } \Gamma^{D},$$

$$\frac{\partial u}{\partial n_{\mathcal{L}}} + a^{R}u = g^{R} \qquad \text{on } \Gamma^{R}.$$

where

• $\mathcal{L} := \mathcal{L}_{\begin{pmatrix} \alpha & 0 \\ 0 & \alpha \end{pmatrix}, \mathbf{0}, \mathbf{V}, \beta}$, and then the conormal derivative of u is given by

$$\frac{\partial u}{\partial n_{\mathcal{L}}} := \left\langle \mathbb{A} \nabla u, \boldsymbol{n} \right\rangle - \left\langle \boldsymbol{b} u, \boldsymbol{n} \right\rangle = \alpha \frac{\partial u}{\partial n}.$$

- f := 0
- $\Gamma^D = \Gamma_{21} \cup \Gamma_{22} \cup \Gamma_{23}$
- $\Gamma^R = \Gamma_1 \cup \Gamma_{10} \cup \Gamma_{20}$
- $g^D(x,y) := 20y$ on Γ_{21} , and $g^D := 0$ on $\Gamma_{22} \cup \Gamma_{23}$
- $a^R := 0$ and $a^R := 0$ on Γ^R

The code using the toolbox FC-VFEMP₁ for solving (4.10)-(4.13) is given in Listing 4.6.

Listing 4.5: Stationary heat with potential flow in 2D, Matlabcode (method 1)

```
Lop = Loperator(d,d,\{af,[];[],af\},[],V,b);
bvpHeat=BVP(Th,PDEelt(Lop));
bvpHeat.setDirichlet(21,gD);
bvpHeat.setDirichlet(22, 0);
bvpHeat.setDirichlet(23, 0);
u=bvpHeat.solve();
```

4.2.2 Method 2: have fun with \mathcal{H} -operators

We can merged velocity potential BVP (4.14)-(4.17) and potential flow to obtain the new BVP

\sqrt{Usual} vector BVP 4: Velocity potential and potential flow in 2D

Find $\phi \in H^2(\Omega)$ and $\boldsymbol{V} = (\boldsymbol{V}_1, \boldsymbol{V}_2) \in H^1(\Omega) \times H^1(\Omega)$ such that

$$-\left(\frac{\partial \mathbf{V}_1}{\partial x} + \frac{\partial \mathbf{V}_2}{\partial y}\right) = 0 \text{ in } \Omega, \tag{4.19}$$

$$\boldsymbol{V}_1 - \frac{\partial \phi}{\partial x} = 0 \text{ in } \Omega, \tag{4.20}$$

$$\mathbf{V}_2 - \frac{\partial \phi}{\partial y} = 0 \text{ in } \Omega, \tag{4.21}$$

$$\phi = -20 \text{ on } \Gamma_{21}, \tag{4.22}$$

$$\phi = 20 \text{ on } \Gamma_{20}, \tag{4.23}$$

$$\phi = 20 \text{ on } \Gamma_{20},$$

$$\frac{\partial \phi}{\partial n} = 0 \text{ on } \Gamma_1 \cup \Gamma_{23} \cup \Gamma_{22}$$

$$(4.23)$$

We can also replace (4.19) by $-\Delta \phi = 0$.

 $\begin{pmatrix} \phi \\ V_1 \end{pmatrix}$, the previous problem (4.19)-(4.24) can be equivalently expressed as the vector BVP (1.14)-(1.16):

Vector BVP 4: Velocity potential and potential flow in 2D

Find $\boldsymbol{w} = (\boldsymbol{w}_1, \boldsymbol{w}_2, \boldsymbol{w}_3) \in (\mathrm{H}^2(\Omega))^3$ such that

$$\mathcal{H}(\boldsymbol{w}) = \boldsymbol{f} \qquad \text{in } \Omega, \tag{4.25}$$

$$\boldsymbol{w}_{\alpha} = g_{\alpha}^{D}$$
 on Γ_{α}^{D} , $\forall \alpha \in [1, 3]$, (4.26)

$$\frac{\partial \boldsymbol{w}}{\partial n_{\mathcal{H}_{\alpha}}} + a_{\alpha}^{R} \boldsymbol{w}_{\alpha} = g_{\alpha}^{R} \qquad \text{on } \Gamma_{\alpha}^{R}, \ \forall \alpha \in [1, 3],$$

$$(4.27)$$

where $\Gamma_{\alpha}^R = \Gamma_{\alpha}^D = \emptyset$ for all $\alpha \in \{2,3\}$ (no boundary conditions on \pmb{V}_1 and \pmb{V}_2) and

• \mathcal{H} is the 3-by-3 operator defined by

$$\mathcal{H} = \begin{pmatrix} 0 & \mathcal{L}_{\mathbb{O}, -\boldsymbol{e}_1, \mathbf{0}, 0} & \mathcal{L}_{\mathbb{O}, -\boldsymbol{e}_2, \mathbf{0}, 0} \\ \mathcal{L}_{\mathbb{O}, \mathbf{0}, -\boldsymbol{e}_1, 0} & \mathcal{L}_{\mathbb{O}, \mathbf{0}, \mathbf{0}, 1} & 0 \\ \mathcal{L}_{\mathbb{O}, \mathbf{0}, -\boldsymbol{e}_2, 0} & 0 & \mathcal{L}_{\mathbb{O}, \mathbf{0}, \mathbf{0}, 1} \end{pmatrix}$$

its conormal derivative are given by

$$\begin{split} \frac{\partial \boldsymbol{w}_1}{\partial n_{\mathcal{H}_{1,1}}} &= 0, & \frac{\partial \boldsymbol{w}_2}{\partial n_{\mathcal{H}_{1,2}}} &= \boldsymbol{w}_2 \boldsymbol{n}_1, & \frac{\partial \boldsymbol{w}_3}{\partial n_{\mathcal{H}_{1,3}}} &= \boldsymbol{w}_3 \boldsymbol{n}_2, \\ \frac{\partial \boldsymbol{w}_1}{\partial n_{\mathcal{H}_{2,1}}} &= 0, & \frac{\partial \boldsymbol{w}_2}{\partial n_{\mathcal{H}_{2,2}}} &= 0, & \frac{\partial \boldsymbol{w}_3}{\partial n_{\mathcal{H}_{2,3}}} &= 0 \\ \frac{\partial \boldsymbol{w}_1}{\partial n_{\mathcal{H}_{3,1}}} &= 0, & \frac{\partial \boldsymbol{w}_2}{\partial n_{\mathcal{H}_{3,2}}} &= 0, & \frac{\partial \boldsymbol{w}_3}{\partial n_{\mathcal{H}_{3,3}}} &= 0. \end{split}$$

So we obtain

$$\frac{\partial \boldsymbol{w}}{\partial n_{\mathcal{H}_1}} \stackrel{\text{def}}{=} \sum_{\alpha=1}^{3} \frac{\partial \boldsymbol{w}_{\alpha}}{\partial n_{\mathcal{H}_{1,\alpha}}} = \langle \boldsymbol{V}, \boldsymbol{n} \rangle = \frac{\partial \phi}{\partial \boldsymbol{n}}, \tag{4.28}$$

and

$$\frac{\partial \mathbf{w}}{\partial n_{\mathcal{H}_2}} = \frac{\partial \mathbf{w}}{\partial n_{\mathcal{H}_3}} := 0. \tag{4.29}$$

From (4.29), we cannot impose boundary conditions on components 2 and 3.

- f := 0
- $\Gamma_1^D = \Gamma_{20} \cup \Gamma_{21}$ and $\Gamma_1^R = \Gamma_1 \cup \Gamma_{10} \cup \Gamma_{22} \cup \Gamma_{23}$
- $g_1^D := 20$ on Γ_{20} , and $g_1^D := -20$ on Γ_{21}
- $g_1^R = a_1^R := 0 \text{ on } \Gamma_1^R$

The solution of this vector BVP is obtain by using the Matlab code is given by Listing 4.6.

Listing 4.6: Stationary heat with potential flow in 2D, Matlab code (method 1)

```
 \begin{aligned} & d \! = \! 2; \\ & Hop \! = \! Hoperator(d,d,3); \\ & Hop.set(1,2,Loperator(d,d,[],\{-1,0\},[],[])); \\ & Hop.set(1,3,Loperator(d,d,[],\{-1,0\},[])); \\ & Hop.set(2,1,Loperator(d,d,[],[],\{-1,0\},[])); \\ & Hop.set(2,2,Loperator(d,d,[],[],[],1)); \\ & Hop.set(3,1,Loperator(d,d,[],[],\{0,-1\},[])); \\ & Hop.set(3,3,Loperator(d,d,[],[],[],1)); \\ & bvpFlow \! = \! BVP(Th,PDEelt(Hop)); \\ & bvpFlow.setDirichlet(20,20,1); \\ & bvpFlow.setDirichlet(21,-20,1); \\ & U \! = \! bvpFlow.solve('split',true); \end{aligned}
```

4.3 Stationary heat with potential flow in 3D

Let $\Omega \subset \mathbb{R}^3$ be the cylinder given in Figure 4.6.

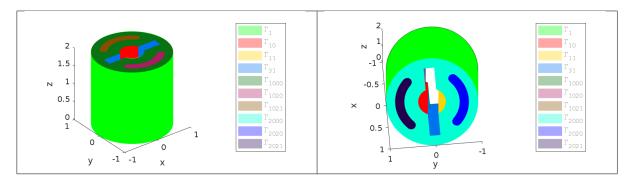

Figure 4.6: Stationary heat with potential flow: 3d mesh

The bottom and top faces of the cylinder are respectively $\Gamma_{1000} \cup \Gamma_{1020} \cup \Gamma_{1021}$ and $\Gamma_{2000} \cup \Gamma_{2020} \cup \Gamma_{2021}$. The hole surface is $\Gamma_{10} \cup \Gamma_{11} \cup \Gamma_{31}$ where $\Gamma_{10} \cup \Gamma_{11}$ is the cylinder part and Γ_{31} the plane part.

The 3D problem to solve is the following

Find $u \in H^2(\Omega)$ such that $-\operatorname{div}(\alpha \nabla u) + \langle \boldsymbol{V}, \nabla u \rangle + \beta u = 0 \text{ in } \Omega \subset \mathbb{R}^3, \qquad (4.30)$ $u = 30 \text{ on } \Gamma_{1020} \cup \Gamma_{2020}, \qquad (4.31)$ $u = 10\delta_{|z-1|>0.5} \text{ on } \Gamma_{10}, \qquad (4.32)$ $\frac{\partial u}{\partial n} = 0 \text{ otherwise}$

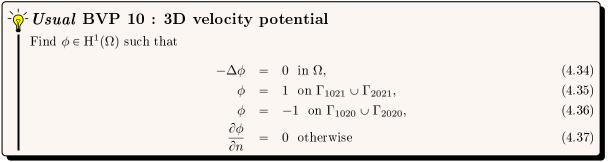

where Ω and its boundaries are given in Figure 4.6. This problem is well posed if $\alpha(\boldsymbol{x}) > 0$ and $\beta(\boldsymbol{x}) \geq 0$.

We choose α and β in Ω as :

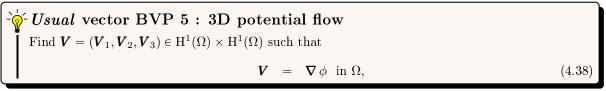

$$\alpha(\mathbf{x}) = 1 + (x_3 - 1)^2;,$$

 $\beta(\mathbf{x}) = 0.01$

The potential flow is the velocity field $\boldsymbol{V} = \boldsymbol{\nabla} \phi$ where the scalar function ϕ is the velocity potential solution of the 3D BVP (4.34)-(4.37)

Then the potential flow V is solution of (4.38)

For a given mesh, the numerical result for heat u is represented in Figure 4.7, velocity potential ϕ and potential flow \boldsymbol{V} are shown in Figure 4.8.

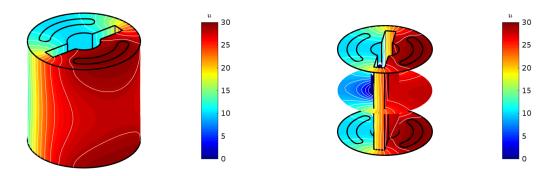

Figure 4.7: Heat solution u

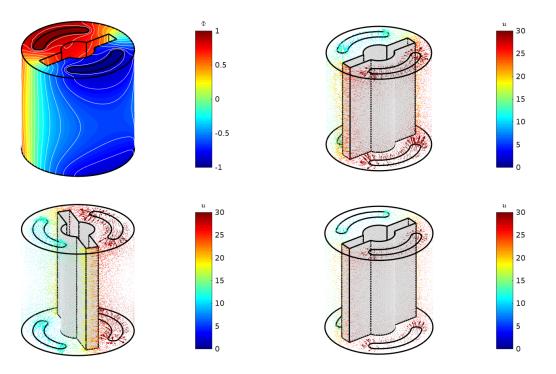

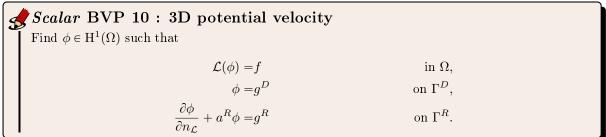

Figure 4.8: Velocity potential Φ (bottom) and velocity field $\boldsymbol{V} = \boldsymbol{\nabla} \Phi$ (upper)

Now we will present two manners of solving these problems using FC-VFEM \mathbb{P}_1 codes.

4.3.1 Method 1 : split in three parts

The 3D potential velocity problem (4.34)-(4.37) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

where

• $\mathcal{L} := \mathcal{L}_{\mathbb{L},\mathbf{0},\mathbf{0},0}$, and then the conormal derivative of ϕ is given by

$$\frac{\partial \phi}{\partial n_{\mathcal{L}}} := \left\langle \mathbb{A} \nabla \phi, \boldsymbol{n} \right\rangle - \left\langle \boldsymbol{b} \phi, \boldsymbol{n} \right\rangle = \frac{\partial \phi}{\partial n}.$$

- f(x) := 0
- $\Gamma^D = \Gamma_{1020} \cup \Gamma_{1021} \cup \Gamma_{2020} \cup \Gamma_{2021}$
- $\Gamma^R = \Gamma_1 \cup \Gamma_{10} \cup \Gamma_{11} \cup \Gamma_{31} \cup \Gamma_{1000} \cup \Gamma_{2000}$
- $g^D:=1$ on $\Gamma_{1021}\cup\Gamma_{2021},$ and $g^D:=-1$ on $\Gamma_{1020}\cup\Gamma_{2020}$
- $g^R = a^R := 0$ on Γ^R . (Neumann boundary condition)

The code using the toolbox for solving (4.34)-(4.37) is given in Listing 4.7

Listing 4.7: Stationary heat with potential flow in 3D, Matlab code (method 1)

```
 \begin{array}{l} d \! = \! 3; dim \! = \! 3; \\ Lop \! = \! Loperator(dim,d, \ \{1,[],[];[],1,[];[],[],[],[]); \\ bvp Flow \! = \! BVP(Th,\!PDEelt(Lop)); \\ bvp Flow.set \, Dirichlet(1021,1.); \\ bvp Flow.set \, Dirichlet(2021,1.); \\ bvp Flow.set \, Dirichlet(1020,-1.); \\ bvp Flow.set \, Dirichlet(2020,-1.); \\ Phi \! = \! bvp Flow.solve(); \\ \end{array}
```

Now to compute V, we can write the potential flow problem (4.38)

• with \mathcal{H} -operators as

$$V = \begin{pmatrix} V_1 \\ V_2 \\ V_2 \end{pmatrix} = \mathcal{B} \begin{pmatrix} \phi \\ \phi \\ \phi \end{pmatrix}$$

where

$$\mathcal{B} = \begin{pmatrix} \mathcal{L}_{\mathbb{O}_3, \mathbf{0}_3, (1,0,0)^t, 1} & 0 & 0 \\ 0 & \mathcal{L}_{\mathbb{O}_3, \mathbf{0}_3, (0,1,0)^t, 0} & 0 \\ 0 & 0 & \mathcal{L}_{\mathbb{O}_3, \mathbf{0}_3, (0,0,1)^t, 0} \end{pmatrix}$$

ullet with \mathcal{L} -operators as

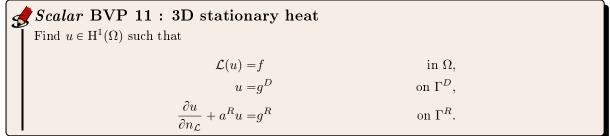

$$\boldsymbol{V} = \begin{pmatrix} \boldsymbol{V}_1 \\ \boldsymbol{V}_2 \\ \boldsymbol{V}_2 \end{pmatrix} = \boldsymbol{\nabla} \, \phi = \begin{pmatrix} \mathcal{L}_{\mathbb{O}_3, \mathbf{0}_3, (1,0,0)^t, 0}(\phi) \\ \mathcal{L}_{\mathbb{O}_3, \mathbf{0}_3, (0,1,0)^t, 0}(\phi) \\ \mathcal{L}_{\mathbb{O}_3, \mathbf{0}_3, (0,0,1)^t, 0}(\phi) \end{pmatrix}$$

The code using FC-VFEMP₁ toolbox for solving this problem with \mathcal{L} -operators is given in Listing 4.8.

Listing 4.8: Stationary heat with potential flow in 3D, Matlab code (method 1)

```
 \begin{split} & \text{Lop=Loperator}(\dim,d,[],[],\{1,0,0\},[]); \\ & V\{1\} = \text{Lop.apply}(\text{Th},\text{Phi}); \\ & \text{Lop=Loperator}(\dim,d,[],[],\{0,1,0\},[]); \\ & V\{2\} = \text{Lop.apply}(\text{Th},\text{Phi}); \\ & \text{Lop=Loperator}(\dim,d,[],[],\{0,0,1\},[]); \\ & V\{3\} = \text{Lop.apply}(\text{Th},\text{Phi}); \end{split}
```

Finally, the stationary heat BVP (4.30)-(??) can be equivalently expressed as the scalar BVP (1.2)-(1.4):

where

• $\mathcal{L}:=\mathcal{L}_{egin{pmatrix} \alpha & 0 & 0 \\ 0 & \alpha & 0 \\ 0 & 0 & \alpha \end{pmatrix}}$, and then the conormal derivative of u is given by

$$\frac{\partial u}{\partial n_{\mathcal{L}}} := \langle \mathbb{A} \nabla u, \boldsymbol{n} \rangle - \langle \boldsymbol{b} u, \boldsymbol{n} \rangle = \alpha \frac{\partial u}{\partial n}.$$

- f := 0
- $\bullet \ \Gamma^D = \Gamma_{1020} \cup \Gamma_{2020} \cup \Gamma_{10}$
- $\Gamma^R = \Gamma_1 \cup \Gamma_{11} \cup \Gamma_{31} \cup \Gamma_{1000} \cup \Gamma_{1021} \cup \Gamma_{2000} \cup \Gamma_{2021}$
- $g^D(x,y,z) := 30$ on $\Gamma_{1020} \cup \Gamma_{2020}$, and $g^D(x,y,z) := 10(|z-1| > 0.5)$ on Γ_{10}
- $g^R := 0$ and $a^R := 0$ on Γ^R

The code using the toolbox for solving (4.30)-(??) is given in Figure 4.9.

Listing 4.9: Stationary heat with potential flow in 3D, Matlab code (method 1)

```
 \begin{array}{l} \mathbf{af} = @(\mathbf{x}, \mathbf{y}, \mathbf{z}) \ 1 + (\mathbf{z} - 1).^2; \\ \mathbf{Lop} = \mathbf{Loperator}(\mathbf{dim}, \mathbf{d}, \{\mathbf{af}, [], [], [], \mathbf{af}\}, [], \{V\{1\}, V\{2\}, V\{3\}\}, 0.01); \\ \mathbf{bvpHeat} = \mathbf{BVP}(\mathbf{Th}, \mathbf{PDEelt}(\mathbf{Lop})); \\ \mathbf{bvpHeat}. \mathbf{setDirichlet}(1020, 30.); \\ \mathbf{bvpHeat}. \mathbf{setDirichlet}(2020, 30.); \\ \mathbf{bvpHeat}. \mathbf{setDirichlet}(10, @(\mathbf{x}, \mathbf{y}, \mathbf{z}) \ 10 * (\mathbf{abs}(\mathbf{z} - 1) > 0.5)); \\ \mathbf{U} = \mathbf{bvpHeat}. \mathbf{solve}(); \\ \end{array}
```

4.3.2 Method 2 : have fun with \mathcal{H} -operators

To solve problem (4.30)-(4.33), we need to compute the velocity field V. For that we can rewrite the potential flow problem (4.34)-(4.37), by introducing $V = (V_1, V_2, V_3)$ as unknowns:

Find $\phi \in H^2(\Omega)$ and $\boldsymbol{V} \in H^1(\Omega)^3$ such that

$$-\left(\frac{\partial \mathbf{V}_1}{\partial x} + \frac{\partial \mathbf{V}_2}{\partial y} + \frac{\partial \mathbf{V}_3}{\partial z}\right) = 0 \text{ in } \Omega, \tag{4.39}$$

$$\mathbf{V}_1 - \frac{\partial \phi}{\partial x} = 0 \text{ in } \Omega, \tag{4.40}$$

$$\mathbf{V}_2 - \frac{\partial x}{\partial y} = 0 \text{ in } \Omega, \tag{4.41}$$

$$\mathbf{V}_3 - \frac{\partial \phi}{\partial z} = 0 \text{ in } \Omega, \tag{4.42}$$

with boundary conditions (4.35) to (4.37).

We can also replace (4.39) by $-\Delta \phi = 0$.

Let $\boldsymbol{w} = \begin{pmatrix} \phi \\ \boldsymbol{V}_1 \\ \boldsymbol{V}_2 \\ \boldsymbol{V}_3 \end{pmatrix}$, the previous PDE can be written as a vector boundary value problem (see section

1.2) where the \mathcal{H} -operator is given by

$$\mathcal{H}(\boldsymbol{w}) = 0 \tag{4.43}$$

with

$$\mathcal{H}_{1,1} = 0,$$
 $\mathcal{H}_{1,2} = \mathcal{L}_{\mathbb{O}, -\boldsymbol{e}_1, \boldsymbol{0}, 0},$ $\mathcal{H}_{1,3} = \mathcal{L}_{\mathbb{O}, -\boldsymbol{e}_2, \boldsymbol{0}, 0},$ $\mathcal{H}_{1,4} = \mathcal{L}_{\mathbb{O}, -\boldsymbol{e}_3, \boldsymbol{0}, 0},$ (4.44)

$$\mathcal{H}_{2,1} = \mathcal{L}_{0,0,-e_1,0}, \qquad \mathcal{H}_{2,2} = \mathcal{L}_{0,0,0,1}, \qquad \mathcal{H}_{2,3} = 0, \qquad \mathcal{H}_{2,4} = 0,$$
 (4.45)

$$\mathcal{H}_{3,1} = \mathcal{L}_{0,\mathbf{0},-\mathbf{e}_2,0}, \qquad \mathcal{H}_{3,2} = 0, \qquad \mathcal{H}_{3,3} = \mathcal{L}_{0,\mathbf{0},\mathbf{0},1}, \qquad \mathcal{H}_{3,4} = 0,$$
 (4.46)

$$\mathcal{H}_{4,1} = \mathcal{L}_{\mathbb{O},\mathbf{0},-\mathbf{e}_3,0}, \qquad \mathcal{H}_{4,2} = 0, \qquad \qquad \mathcal{H}_{4,3} = 0, \qquad \qquad \mathcal{H}_{4,4} = \mathcal{L}_{\mathbb{O},\mathbf{0},\mathbf{0},1}, \qquad (4.47)$$

and $\mathbf{e}_1 = (1,0,0)^t$, $\mathbf{e}_2 = (0,1,0)^t$, $\mathbf{e}_3 = (0,0,1)^t$. The conormal derivatives are given by

$$\frac{\partial \mathbf{w}_1}{\partial n_{\mathcal{H}_{1,1}}} = 0, \qquad \frac{\partial \mathbf{w}_1}{\partial n_{\mathcal{H}_{2,1}}} = 0, \qquad \frac{\partial \mathbf{w}_1}{\partial n_{\mathcal{H}_{3,1}}} = 0, \qquad \frac{\partial \mathbf{w}_1}{\partial n_{\mathcal{H}_{4,1}}} = 0,
\frac{\partial \mathbf{w}_2}{\partial n_{\mathcal{H}_{1,2}}} = \mathbf{V}_1 \mathbf{n}_1, \qquad \frac{\partial \mathbf{w}_2}{\partial n_{\mathcal{H}_{2,2}}} = 0, \qquad \frac{\partial \mathbf{w}_2}{\partial n_{\mathcal{H}_{3,2}}} = 0, \qquad \frac{\partial \mathbf{w}_2}{\partial n_{\mathcal{H}_{4,2}}} = 0,
\frac{\partial \mathbf{w}_3}{\partial n_{\mathcal{H}_{1,3}}} = \mathbf{V}_2 \mathbf{n}_2, \qquad \frac{\partial \mathbf{w}_3}{\partial n_{\mathcal{H}_{2,3}}} = 0, \qquad \frac{\partial \mathbf{w}_3}{\partial n_{\mathcal{H}_{3,3}}} = 0, \qquad \frac{\partial \mathbf{w}_3}{\partial n_{\mathcal{H}_{4,3}}} = 0,
\frac{\partial \mathbf{w}_4}{\partial n_{\mathcal{H}_{1,4}}} = \mathbf{V}_3 \mathbf{n}_3, \qquad \frac{\partial \mathbf{w}_4}{\partial n_{\mathcal{H}_{2,4}}} = 0, \qquad \frac{\partial \mathbf{w}_4}{\partial n_{\mathcal{H}_{3,4}}} = 0, \qquad \frac{\partial \mathbf{w}_4}{\partial n_{\mathcal{H}_{4,4}}} = 0,$$

So we obtain

$$\sum_{\alpha=1}^{4} \frac{\partial \boldsymbol{w}_{\alpha}}{\partial n_{\mathcal{H}_{1,\alpha}}} = \langle \boldsymbol{V}, \boldsymbol{n} \rangle = \langle \boldsymbol{\nabla} \phi, \boldsymbol{n} \rangle, \qquad (4.48)$$

and

$$\sum_{\alpha=1}^{4} \frac{\partial \boldsymbol{w}_{\alpha}}{\partial n_{\mathcal{H}_{2,\alpha}}} = \sum_{\alpha=1}^{4} \frac{\partial \boldsymbol{w}_{\alpha}}{\partial n_{\mathcal{H}_{3,\alpha}}} = \sum_{\alpha=1}^{4} \frac{\partial \boldsymbol{w}_{\alpha}}{\partial n_{\mathcal{H}_{4,\alpha}}} = 0.$$
 (4.49)

From (4.49), we cannot impose boundary conditions on components 2 to 4. Thus, with notation of section

1.2, we have $\Gamma_2^N = \Gamma_3^N = \Gamma_4^N = \Gamma$ with $g_2^N = g_3^N = g_4^N = 0$. To take into account boundary conditions (4.35) to (4.37), we set $\Gamma_1^D = \Gamma_{1020} \cup \Gamma_{1021} \cup \Gamma_{2020} \cup \Gamma_{2021}$, $\Gamma_1^N = \Gamma \setminus \Gamma_1^D$ and $G_1^D = \delta_{\Gamma_{1020} \cup \Gamma_{2020}} - \delta_{\Gamma_{1021} \cup \Gamma_{2021}}$, $G_1^N = 0$. The operator in (4.30) is given by $\mathcal{L}_{\alpha \parallel, \mathbf{0}, \mathbf{V}, \beta}$. The conormal derivative $\frac{\partial u}{\partial n_{\mathcal{L}}}$ is

$$\frac{\partial u}{\partial n_{\mathcal{L}}} := \left\langle \mathbb{A} \, \nabla \, u, \boldsymbol{n} \right\rangle - \left\langle \boldsymbol{b} u, \boldsymbol{n} \right\rangle = \alpha \frac{\partial u}{\partial n}.$$

The code using the toolbox for solving (4.39)-(4.42) is given in Listing 4.10

Listing 4.10: Stationary heat with potential flow in 3D, Matlab code (method 2)

```
d=3:dim=3:m=4:
Hop=Hoperator(dim,d,m);
Hop.set(1,2,Loperator(dim,d,[],\{-1,0,0\},[],[]));
Hop.set(1,4,Loperator(dim,d,[],\{0,0,-1\},[],[]));
\textcolor{red}{\textbf{Hop.set}(2,1,Loperator(\dim,d,[],[],\{-1,0,0\},[]));}
Hop.set(2,2,Loperator(dim,d,[],[],[],1));
Hop.set(3,1,Loperator(dim,d,[],[],\{0,-1,0\},[]));
\operatorname{Hop.set}(3,3,\operatorname{Loperator}(\dim,\operatorname{d},[],[],[],1));
Hop.set(4,1,Loperator(dim,d,[],[],\{0,0,-1\},[]));
\frac{\text{Hop.set}(4,4,\text{Loperator}(\dim,d,[],[],[],1));}{\text{Hop.set}(4,4,\text{Loperator}(\dim,d,[],[],[],1));}
bvpFlow=BVP(Th,PDEelt(Hop));
bvpFlow.setDirichlet(1020,-1,1);
bvpFlow.setDirichlet(1021,1,1);
bvpFlow.setDirichlet(2020,-1,1);
bvpFlow.setDirichlet(2021,1,1);
W=bvpFlow.solve('split',true);
af = @(x,y,z) 1 + (z-1).^2;
Lop = Loperator(dim, d, \{af, [], []; [], af, []; [], [], af\}, [], \{W\{2\}, W\{3\}, W\{4\}\}, 0.01);
bvpHeat=BVP(Th,PDEelt(Lop));
bvpHeat.setDirichlet(1020,30.);
bvpHeat.setDirichlet(2020,30.);
bvpHeat.setDirichlet(10, @(x,y,z) 10*(abs(z-1)>0.5));
U=bvpHeat.solve();
```
