

Octave package, User's Guide*

version 0.2.4

François Cuvelier[†]

January 5, 2023

Abstract

This Octave package make it possible to generate mesh files from `.geo` files by using `gmsh`. It's also possible with the `ooGMSH2` and `ooGMSH4` classes to read the mesh file (respectively for MSH file format version 2.2 and version 4.x). This package must be regarded as a very simple interface between gmsh files and Octave. So you are free to create any data structures or objects you want from an `ooGMSH2` object or an `ooGMSH4` object.

1 Introduction

The `fc_oogmsh` Octave package is closely related to `gmsh`, see [2] or [3], which is a three-dimensional finite element mesh generator with built-in pre- and post-processing facilities. `gmsh` can also build two-dimensional meshes and three-dimensional surface meshes. This package was initially created to make it possible from Octave to rapidly

- generate mesh file from .geo file by using `gmsh`
- efficiently read this mesh file and store its contents in `ooGMSH` Octave object easy to manipulate.

The `ooGMSH` Octave object can be used to create, from a .msh file, any data structures or objects needed by your project. For example, the `fc-simesh` Octave package uses this package to create the `SiMESH` object containing all the simplices elements of the mesh.

This package was only tested on Ubuntu 22.04.1 with Octave 7.3.0.

Firstly, we explain how to configure the `fc_oogmsh` package for using `gmsh`. Thereafter, we describe the `fc_oogmsh`'s functions which use `gmsh` to create mesh files.

2 Installation

2.1 Installation automatic, all in one (recommended)

For automatic installation, one has to get/download the install file

`ofc_oogmsh_install.m`

or get it on the dedicated web page. Thereafter, one run it under Octave. This command download, extract and configure the *fc-oogmsh* toolbox and all the required packages in the current directory.

By default, the gmsh binary is supposed to be located in

- <USERDIR>/bin/gmsh under linux and MacOS,
- <USERDIR>/Softwares/GMSH/gmsh.exe under Windows 10

It can be directly given by using the '*gmsh_bin*' option of the install command:

```
>> ofc_oogmsh_install('gmsh_bin', GMSH)
```

where GMSH is the gmsh binary with path as a string. It's also possible, after installation, to change the gmsh binary by using the Octave command

```
>> fc_oogmsh.configure('gmsh_bin','~/gmsh-4.11.0/bin/gmsh')
```

For example, to install this package in *~/Octave* directory, one have to copy the file *ofc_oogmsh_install.m* in the *~/Octave* directory. Then in a Octave terminal run the following commands

```
>> cd ~/Octave
>> ofc_oogmsh_install
```

There is the output of the *ofc_oogmsh_install* command:

```

addpath('~/Octave/fc-oogmsh-full/fc_oogmsh-0.2.4')

See ~/Octave/ofc_oogmsh_set.m
```

The complete toolbox (i.e. with all the other needed packages) is stored in the directory
~/Octave/fc-oogmsh-full

and, for each Octave session, one has to set the package by:

```
>> addpath('~/Octave/fc-oogmsh-full/fc_oogmsh-0.2.4')
>> fc_oogmsh.init()
```

If it's the first time the *fc_oogmsh.init()* function is used, then its output is

```

Use fc_tools.configure to configure.
Write in ~/Octave/fc-oogmsh-full/fc_tools-0.0.34/configure_loc.m ...

```

Otherwise, the output of the *fc_oogmsh.init()* function is

```

```

For **uninstalling**, one just has to delete directory:

```
~/Octave/fc-oogmsh-full
```

3 gmsh interface

All functions provided in this section use **gmsh** to create a mesh file from a **gmsh** geometry script file (extension *.geo*).

3.1 function `fc_oogmsh.gmsh.buildmesh2d`

This function uses **gmsh** and a *.geo* file (describing a 2D-geometry) to generate a 2D-mesh.

Syntaxe

```
meshfile=fc_oogmsh.gmsh.buildmesh2d(geofile,N)
meshfile=fc_oogmsh.gmsh.buildmesh2d(geofile,N,Name,Value)
```

Description

`meshfile=fc_oogmsh.gmsh.buildmesh2d(geofile,N)` create a 2D-mesh using **gmsh** and the *geo* file *geofile* (without path). The integer *N* has two functions : numbering the name of the generated mesh as <geofile without extension and path> + <-N.msh> and passing this number to **gmsh** via the option "-setnumber N <N>". Usually we used this parameter in **gmsh** to set the prescribed mesh element size at the points. (see given *geo* files)

As output return a file name (with full path) corresponding to the mesh generated by **gmsh**.

`meshfile=fc_oogmsh.gmsh.buildmesh2d(geofile,N,Name,Value, ...)` specifies function options using one or more *Name,Value* pair arguments. The *Name* options can be

- '`geodir`' : to specify the directory of the *geo* file *geofile*,
- '`meshdir`' : to specify the directory where the mesh file will be written,
- '`meshfile`' : to specify the name of the mesh file (with path and *.msh* extension),
- '`check`' : to perform various consistency checks on mesh with **gmsh**, if *Value* is `true`. (default : `false`)
- '`force`' : to force meshing even if the mesh file already exists if *Value* is `true` (default : `false`)
- '`verbose`' : to specify the degree of verbosity (0, silence; 2, default; ...)
- '`strings`' : cells array of strings corresponding to **gmsh** options given with `-string "..."` (default empty) (see **gmsh** documentation). For example, *Value* could be:

```
{'Mesh.Algorithm=1;', 'Mesh.ScalingFactor=2;'}
```

- '`MshFileVersion`' : to specify the MSH file format version. *Value* could be
 - '`2.2`' if gmsh version $\geq 2.16.0$,
 - '`4.0`' if gmsh version $\geq 4.0.0$,
 - '`4.1`' if gmsh version $\geq 4.1.0$.

Examples All the following examples use the `.geo` file `condenser11.geo` which is in the directory `geodir` of the package.

```

3.2 function fc_oogmsh.gmsh.buildmesh3d

This function uses `gmsh` and a `.geo` file (describing a 3D-geometry) to generate a 3D-mesh. See function `gmsh.buildmesh2d` for usage and options (section 3.1).

3.3 function fc_oogmsh.gmsh.buildmesh3ds

This function uses `gmsh` and a `.geo` file (describing a 3D surface geometry or a 3D-geometry) to generate a 3D surface mesh. See function `gmsh.buildmesh2d` for usage and options (section 3.1).

3.4 function `fc_oogmsh.gmsh.buildpartmesh2d`

This function uses `gmsh` and a `.msh` file (containing a 2D-mesh) to generate a 2D partitioned mesh.

Syntaxe

```
partmeshfile=fc_oogmsh.gmsh.buildpartmesh2d(meshfile,np)  
partmeshfile=fc_oogmsh.gmsh.buildpartmesh2d(meshfile,np,Name,Value)
```

Description

`partmeshfile=fc_oogmsh.gmsh.buildpartmesh2d(meshfile,np)` create a 2D partitioned mesh using `gmsh` and the `msh` file `meshfile` (with path). The integer `np` is the number of partitions.

As output return a file name (with full path) corresponding to the partitioned mesh generated by `gmsh`. The output file name is construct as following : <meshfile without extension>-part<np>.msh

`partmeshfile=fc_oogmsh.gmsh.buildpartmesh2d(meshfile,np,Name,Value, ...)` specifies function options using one or more `Name,Value` pair arguments. The `Name` options can be

- `'savedir'` : to specify the directory where the partitioned mesh file will be written,
- `'check'` : to perform various consistency checks on mesh with `gmsh`, if `Value` is `true`. (default : `false`)
- `'force'` : to force meshing even if the mesh file already exists if `Value` is `true` (default : `false`)
- `'verbose'` : to specify the degree of verbosity (0, silence; 2, default; ...)
- `'strings'` : cells array of strings corresponding to `gmsh` options given with `-string "..."` (default empty) (see `gmsh` documentation)
- `'MshFileVersion'` : to specify the MSH file format version. `Value` could be
 - `'2.2'` if `gmsh` version $\geq 2.16.0$,
 - `'4.0'` if `gmsh` version $\geq 4.0.0$,
 - `'4.1'` if `gmsh` version $\geq 4.1.0$.

This function uses `gmsh` and a `.msh` file (containing of a 3D surface mesh) to generate a 3D partitioned surface mesh. See function `gmsh.buildpartmesh2d` for usage and options (section 3.4).

3.7 function `fc_oogmsh.gmsh.buildPartRectangle`

This function uses `gmsh` and the `geodir/rectanglepart.geo` file to generate a 2D regular partitioned mesh of the rectangle $[0, L_x] \times [0, L_y]$ with `Nx` \times `partitions.`

Syntaxe

```
meshfile=fc_oogmsh.gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N)
meshfile=fc_oogmsh.gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N, Name, Value)
```

Description

```
meshfile=fc_oogmsh.gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N)
```

create a 2D regular partitioned mesh using `gmsh` of the rectangle $[0, L_x] \times [0, L_y]$ with `Nx` \times `partitions. The N parameter is passed to gmsh to set the prescribed mesh element size at the points As output return a file name (with full path) corresponding to the partitioned mesh generated by gmsh. The default output file name is construct as following :`

```
sprintf('rectanglepart-Lx%.3f-Ly%.3f-Nx%d-Ny%d.d.msh',Lx,Ly,Nx,Ny,N)
```

`meshfile=fc_oogmsh.gmsh.buildpartrectangle(Lx,Ly,Nx,Ny,N,Name,Value, ...)` specifies function options using one or more Name,Value pair arguments (see the `fc_oogmsh.gmsh.buildmesh2d`, section 3.1).

4 ooGmsh4 class (version 4.x)

The `ooGmsh4` class can be used to read `gmsh` mesh files with the MSH ASCII file format version 4.1 since `gmsh 4.1.0` ([4], section 9.1) or version 4.0 since `gmsh 4.0.0`.

The `gmsh`'s native "MSH" file format (version 4.x) is used to store meshes and associated post-processing datasets either save as an ASCII file or a binary file with extension `.msh`. The focus of the `ooGmsh4` class is to read only meshes contained in an ASCII file. Currently, it is not planned to read post-processing datasets.

As described in [4], section 9.1: *the MSH file format version 4 (current revision: version 4.1) contains one mandatory section giving information about the file (\$MeshFormat), followed by several optional sections defining the physical group names (\$PhysicalName), the elementary geometrical enti-*

ties (\$Entities), the partitioned entities (\$PartitionedEntities), the nodes \$Nodes, the elements (\$Elements), the periodicity relations (\$Periodic), the ghost elements (\$GhostElements) and the post-processing datasets (\$NodeData, \$ElementData, \$ElementNodeData).

For each section, the `ooGMSH4` class has a property with corresponding name. The properties of this class are:

Properties of <code>ooGMSH4</code> class	
<code>dim</code>	: space dimension (2 or 3)
<code>nq</code>	: number of nodes/vertices.
<code>q</code>	: nodes/vertices array with dimension <code>dim</code> -by- <code>nq</code> .
<code>toGlobal</code>	: ...
<code>MeshFormat</code>	: structure
<code>PhysicalNames</code>	: (optional), array of <code>PhysicalName</code> structure
<code>Entities</code>	: structure
<code>PartitionedEntities</code>	: (optional) structure
<code>Nodes</code>	: structure
<code>Elements</code>	: structure
<code>PeriodicLinks</code>	: (optional), array of <code>PeriodicLink</code> structure

The structures `MeshFormat`, `PhysicalNames`, `Entities`, `PartitionedEntities`, `Nodes`, `Elements` and `PeriodicLinks` are described in section 4.2. In the following subsections, `Gh` is an `ooGmsh4` object.

4.1 Methods

4.1.1 `ooGms4` constructor

The `ooGmsh4` class have only one constructor :

```
Gh=f c _o o g m s h . o o G m s h 4 ( meshfile )
Gh=f c _o o g m s h . o o G m s h 4 ( meshfile , 'verbosity' , Value )
```

where `meshfile` is the name of ... a mesh file. The '`verbosity`' Key/Value option can be used to print some informations, when reading the file `meshfile`, if `Value` is `true`. Default is `false`

Octave code with output

```

fprintf('1) Building the mesh\n')
meshfile=fc_oogmsh.gmsh.buildmesh2d('condenser',10, ...
    'verbose',0,'force',true);
fprintf('2) Reading the mesh\n');

Gh.info()
Gh.info(Key, Value, ...)

```

Description

Gh.info()

print informations on class fields with 3 levels of recursivity (i.e. field of field of field).

Gh.info(Key, Value, ...)

specifies function options using one or more **Key,Value** pair arguments. The **Key** options can be

- '**maxlevel**' : level of recursivity, default is 3.
- '**tab**' : number of space characters between two levels of recursivity, default is 4.

5 ooGmsh2 class (version 2.2)

The **ooGmsh2** class can be used to read gmsh mesh files with the MSH ASCII file format (version 2.2) described for example in [3], section 9.1. A MSH file can contain various mesh elements which are identified by an *elm-type* integer given in Appendix A. One can also refer to the `fc_oogmsh.gmsh.elm_type_desc` function, described in Appendix B.1, to obtain information on a given *elm-type*.

When reading a MSH file (format 2.2) generated by `gmsh`, we split the mesh elements by *elm-type* and generate an array of `Elmt` structure. The dimension of this array is the number of differents *elm-type* founds on the .msh file.

The `Elmt` structure is given by

Fields of Elmt structure

<code>type</code>	: integer, refers to the type of the element : 1 for 2-node line, 2 for 3-node triangle, ... See the <code>elm-type</code> description of [3], section 9.1. Informations on a given <code>type</code> can be obtained by using <code>elt=fc_oogmsh.gmsh.elm_type_desc(type)</code> .
<code>geo</code>	: string, contains the kind of geometry: 'line', 'triangle', 'tetrahedron', ...
<code>d</code>	: integer, space dimension or <code>d</code> -simplex.
<code>order</code>	: integer, order of the element.
<code>nme</code>	: integer, number of mesh elements.
<code>me</code>	: array of <code>nb_nodes</code> -by- <code>nme</code> integers, connectivity array. <code>nb_nodes</code> is equal to <code>elt.nb_nodes</code> where <code>elt=fc_oogmsh.gmsh.elm_type_desc(type)</code> .
<code>phys_lab</code>	: array of <code>nme</code> -by-... integers, physical labels of the elements.
<code>geo_lab</code>	: array of <code>nme</code> -by-... integers, geometrical labels of the elements.
<code>nb_parts</code>	: array of <code>nme</code> -by-1 integers, number of mesh partitions to which the element belongs.
<code>part_lab</code>	: array of <code>nme</code> -by- <code>max(nb_parts)</code> integers, <code>part_lab(i, 1 : nb_parts(i))</code> contains all the partitions index to which the <i>i</i> -th element belongs.

The `ooGMSH2` class was created to store a maximum of(all the) information(s) contained in the .msh file. The properties of this class are:

Properties of `ooGMSH` class

<code>dim</code>	: integer space dimension
<code>nq</code>	: integer number of vertices/nodes
<code>q</code>	: <code>dim</code> -by- <code>nq</code> array of reals array of vertex coordinates
<code>types</code>	: array of integers List of the element types found in the mesh file.
<code>orders</code>	: array of integers List of the orders of the element types found in the mesh file.
