1 Introduction

This **experimental** Octave package uses the [graphics4mesh](#) package[1] to do some graphic representations on a **siMesh** object of the [simesh](#) package[2].

In Listing 1, a 2D example is provided with the 4 generated figures. For graphic representations, one can also used `Th.plotmesh(...)` instead of `fc_siplt.plotmesh(Th,...)`, `Th.plot(...)` instead of `fc_siplt.plot(Th,...)` and so on.

2 Installation

This package was only tested on Ubuntu 24.04.1 with Octave 9.3.0.

One just has to get/download the install file

ofc_siplt_install.m

or get it on the dedicated web page. Thereafter, one run it under Octave. This command download, extract and configure the *fc-siplt* package and all the required packages in the current directory.

For example, to install this package in `~/Octave/packages` directory, one have to copy the file `mfc_siplt_install.m` in the `~/Octave/packages` directory. Then in a Octave terminal run the following commands

```
>> cd ~/Octave/packages
>> mfc_siplt_install
```

There is the output of the `mfc_siplt_install` command on a Linux computer:

```

3 `fc_siplt.plotmesh` function

The `fc_siplt.plotmesh` function displays the mesh or parts of the mesh defined by an `siMesh` object.

Syntaxe

```
fc_siplt.plotmesh(Th)
fc_siplt.plotmesh(Th,Name,Value, ...)
```

Description

`fc_siplt.plotmesh(Th)` displays all the $(Th.d)$ -dimensional simplices elements of `Th`, a `siMesh` object.

`fc_siplt.plotmesh(Th,Name,Value, ...)` specifies function options using one or more `Name,Value` pair arguments. Options of first level are

- `'d'` : to specify the dimension of the simplices elements (default : `Th.d`)
- `'labels'` : to select the labels of the elements to display,
- `'color'` : to specify the color of the displayed mesh elements. (default : use one color by displayed mesh elements),
- `'inlegend'` : add a legend name to graph if true (default : `false`)
- `'bounds'` : If `true`, draw the borders of the selected elementaries mesh elements (only for 2-dimensional simplices). (default : `false`)
- `'cutPlane'` : cut mesh by n plans given by n -by-4 array P where the equation of the i -th cut plane is given by

$$P(i,1)x + P(i,2)y + P(i,3)z + P(i,4) = 0.$$

The normal vector $P(i,1 : 3)$ pointed to the part of the mesh not displayed. (only for simplices in dimension 3) default : `[]` (no cut).

The options of second level depend on the type of elementaries mesh elements to represent.

One can use any option of the following functions according to the type of d -simplex to be represented.

The data `u` is an 1D-array of size `Th.nq` or `Th.nqGlobal` or `Th.nqParent`. To compute P one can use the function `fc_tools.graphics.PlaneCoefs` of the `fc_tools` package. With this function, the array `P`, is obtained with $P = \text{fc_tools.graphics.PlaneCoefs}(Q,V)$ where `Q` is a point in the plane and `V` is a vector orthogonal to the plane.

`fc_siplt.sliceiso(Th,u,P,key,value,...)` allows additional key/value pairs to be used when displaying `u`. The key strings could be

- `'labels'` : to select the labels of the elements to intersect,
- `'niso'` : to specify the number of isolines (default : 10)
- `'isorange'` : to specify the list of isovalues (default : empty)
- `'color'` : to specify one color for all isolines (default : empty)
- `'isocolorbar'` : if true display a colorbar. Default is false.
- `'format'` : to specify the format of the isovalues print in the colorbar. Default is `'%g'`.

For key strings, one could also used any options of the `plot3` function.

This function accepts until 4 output arguments :

- 1st output is the colors of the isolines
- 2nd output is the isovalues of the isolines
- 3th output is the handle of the colobar iso.
- 4th output is all the handles of the isolines as an 2D-array of dimension N-by-niso, where N is the number of elementary meshes where isolines are drawn.

- `'freq'` : quiver frequencie, (default : 1)
- `'scale'` : quiver scale, (default : ...)
- `'colordata'` : set colors on each quiver (default : empty).

The options of second level depend on space dimension and `'colordata'` option. One can use any option of the following functions

- `quiver` function in dimension 2 with an empty `'colordata'`
- `quiver3` function in dimension 3 with an empty `'colordata'`
- `vfield3` function in dimension 2 or 3 with `'colordata'` set to an 1D-array of length `Th.nq`.
