

The image shows a mathematical identity between Feynman diagrams. On the left is a four-point vertex diagram, represented by a central black dot with four lines extending from it: one vertical line pointing downwards and three lines pointing upwards (one vertical, two diagonal). This diagram is followed by an equals sign with two horizontal bars ( $\equiv$ ).

To the right of the equals sign is the first term of a difference: a diagram consisting of two separate three-point vertices. The left vertex has two incoming lines labeled 'i' at the top and one outgoing line labeled 'h' pointing downwards. The right vertex has one incoming line labeled 'i' at the top and one outgoing line labeled 'p' pointing downwards.

This is followed by a minus sign (-), and then the second term of the difference: another diagram with two separate three-point vertices. The left vertex has one incoming line labeled 'i' at the top and one outgoing line labeled 'p' pointing downwards. The right vertex has two incoming lines labeled 'i' at the top and one outgoing line labeled 'h' pointing downwards.
